

Operational Efficiency Hacks

John Allspaw
Operations Engineering, Flickr

who am I?

Manage the Flickr Operations group

Wrote a geeky book:

“Efficiencies”

“Efficiencies”

Doing more with the robots you've got

“Efficiencies”

Doing more with the robots you've got
Doing more with the humans you've got

Some optimization “rules”

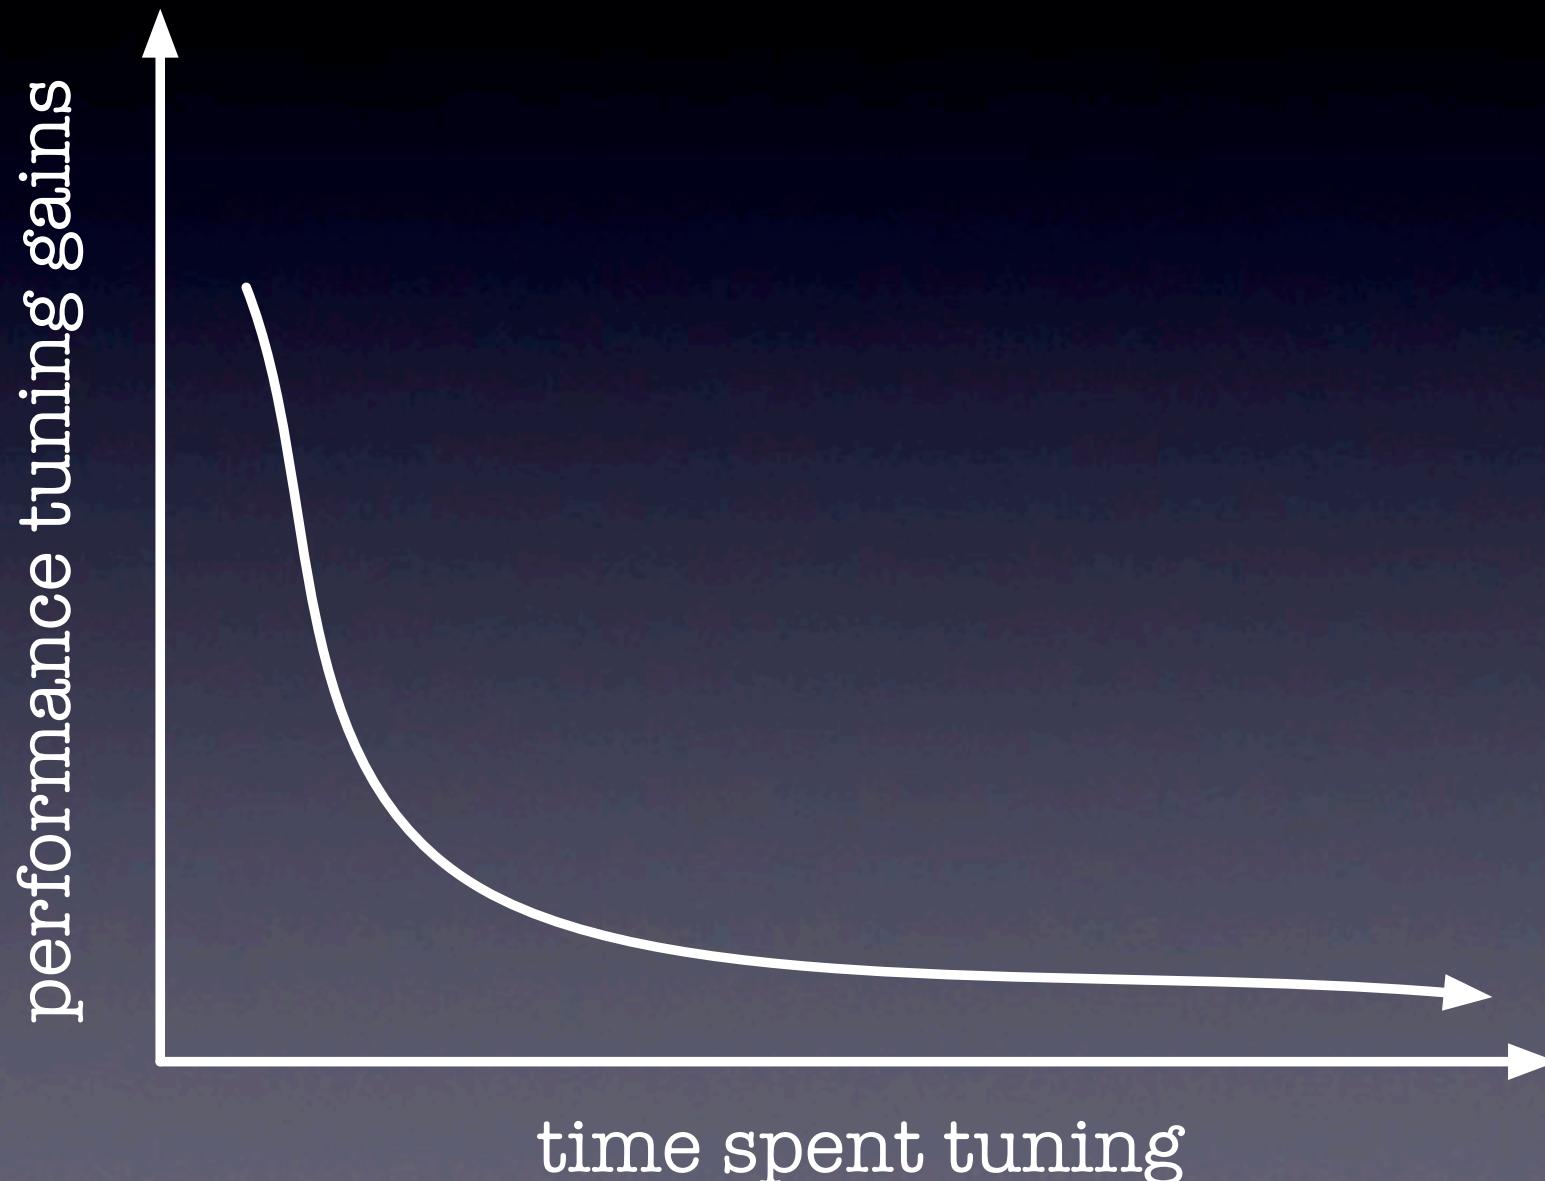

Some optimization “rules”

- Don't rely on being able to tweak anything.

Some optimization “rules”

- Don't rely on being able to tweak anything.
- Don't waste too much time tuning when you have no evidence it'll matter.

Optimization “rules”

Optimization “rules”

*“We should forget about small efficiencies,
say about 97% of the time: premature
optimization is the root of all evil.”*

Knuth, (or Hoare)

however...

Optimization “rules”

• Rule 1: If you’re not learning, you’re not growing.

• Rule 2: If you’re not failing, you’re not trying.

• Rule 3: If you’re not failing, you’re not growing.

• Rule 4: If you’re not failing, you’re not trying.

• Rule 5: If you’re not failing, you’re not growing.

• Rule 6: If you’re not failing, you’re not trying.

• Rule 7: If you’re not failing, you’re not growing.

• Rule 8: If you’re not failing, you’re not trying.

• Rule 9: If you’re not failing, you’re not growing.

• Rule 10: If you’re not failing, you’re not trying.

• Rule 11: If you’re not failing, you’re not growing.

• Rule 12: If you’re not failing, you’re not trying.

• Rule 13: If you’re not failing, you’re not growing.

• Rule 14: If you’re not failing, you’re not trying.

Optimization “rules”

That doesn't give us an excuse to be lazy and inefficient.

Optimization “rules”

That doesn't give us an excuse to be lazy and inefficient.

Optimization “rules”

That doesn't give us an excuse to be lazy and inefficient.

We lean on the experience of people in the community for evidence that tuning(s) might be a worthwhile thing to do.

Optimization “rules”

“Yet we should not pass up our opportunities in that critical 3 percent.”

Knuth, (or Hoare)

So...

stop somewhere
in here

←
**obvious
tuning
wins**

→
**OMG
I'm wasting
!@#\$ time
for no reason**

Our Context

A photograph of a large-scale solar panel array. The panels are tilted at an angle and are arranged in several rows. The sky above is dark and filled with streaky, light-colored clouds. In the background, there's a low building and some trees.

Our Context

- 24 TB of MySQL data

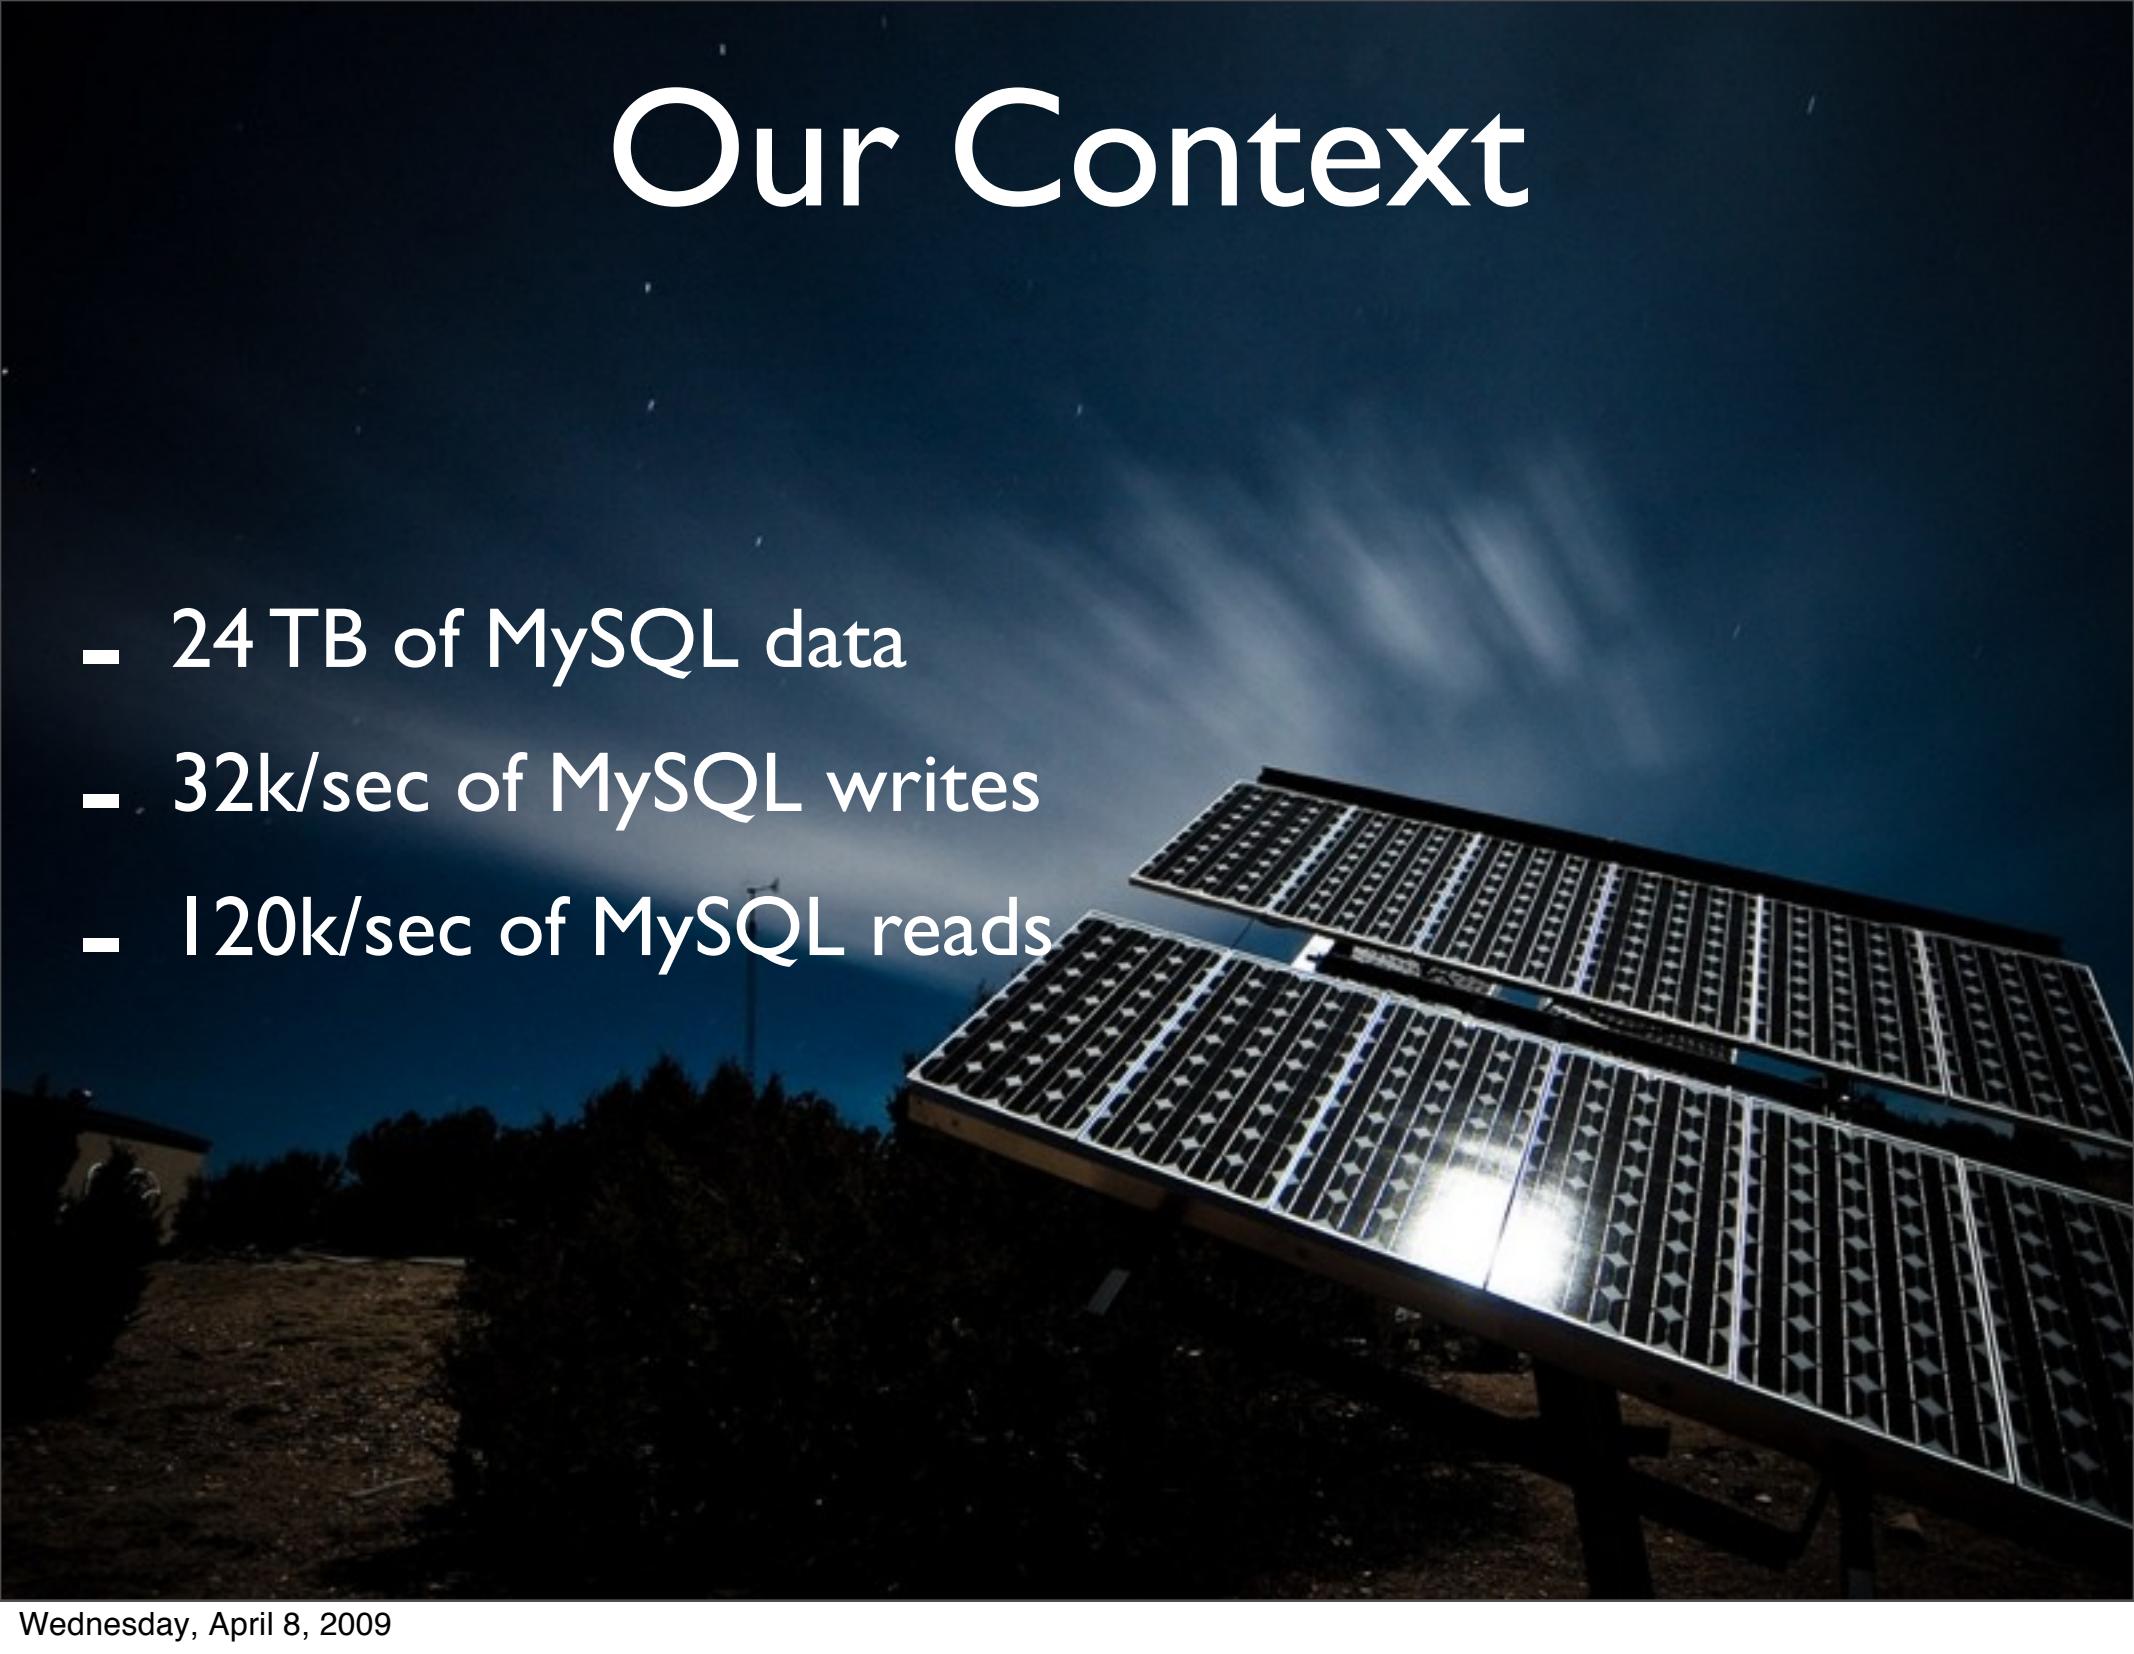

Our Context

- 24 TB of MySQL data
- 32k/sec of MySQL writes

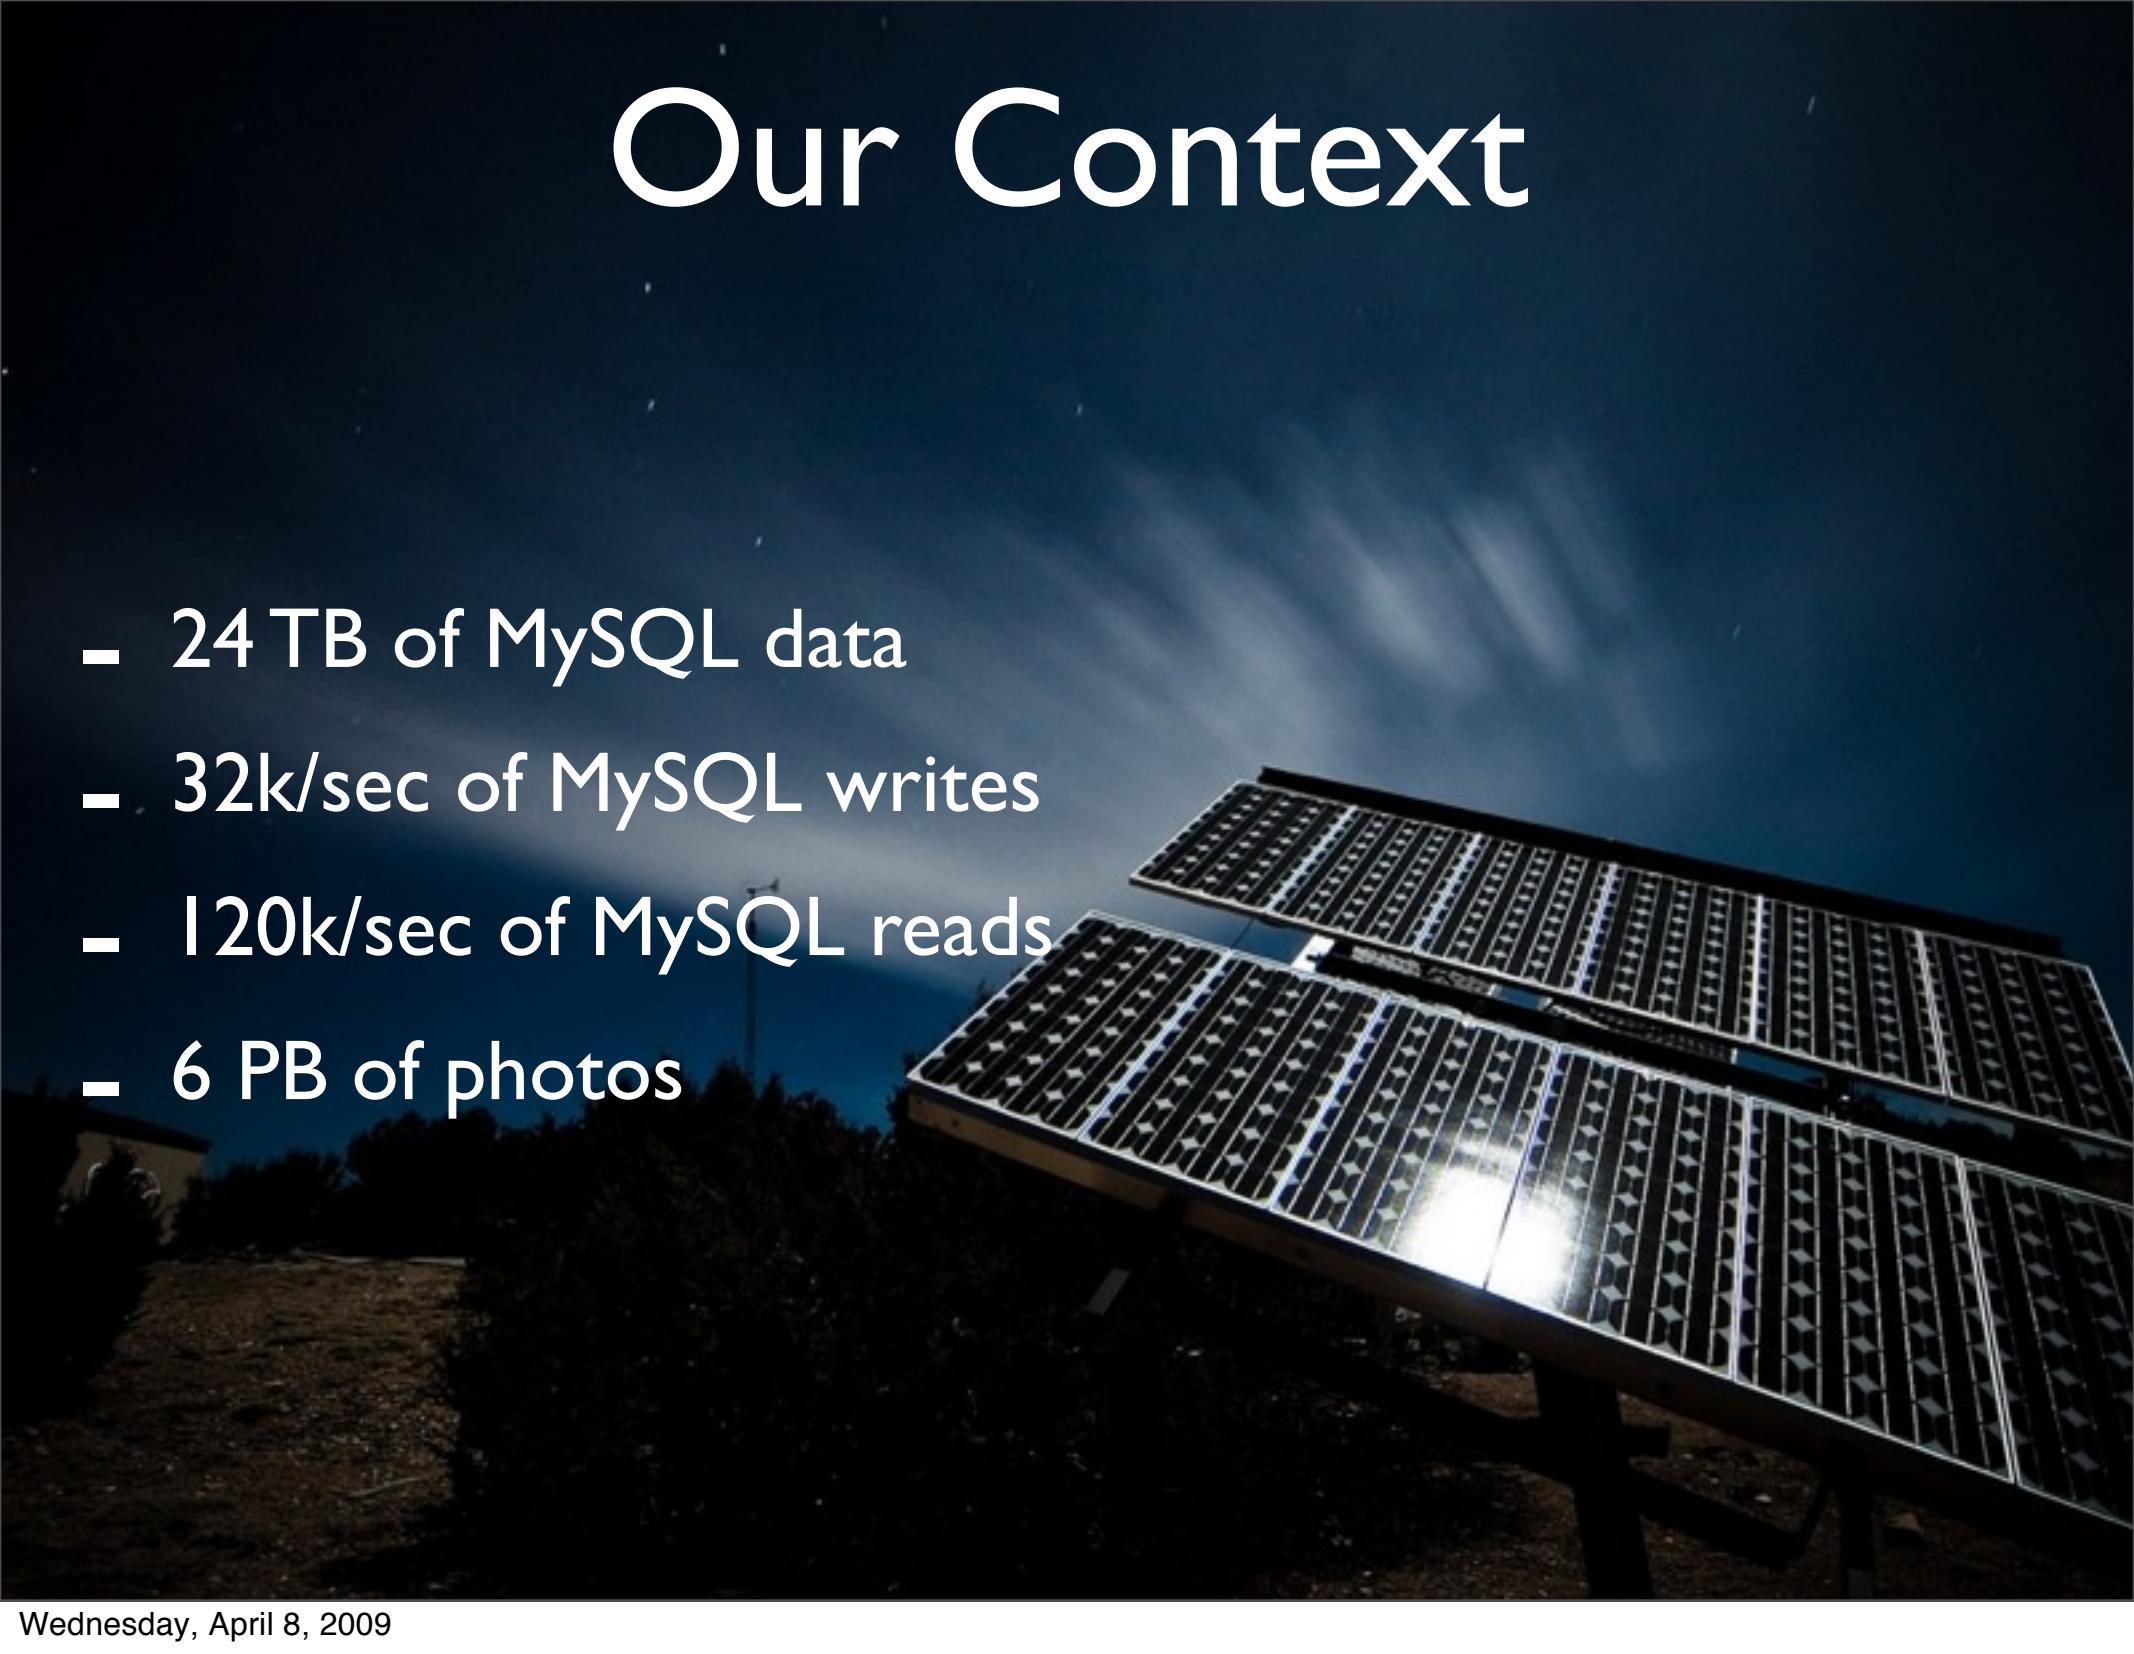

Our Context

- 24 TB of MySQL data
- 32k/sec of MySQL writes
- 120k/sec of MySQL reads

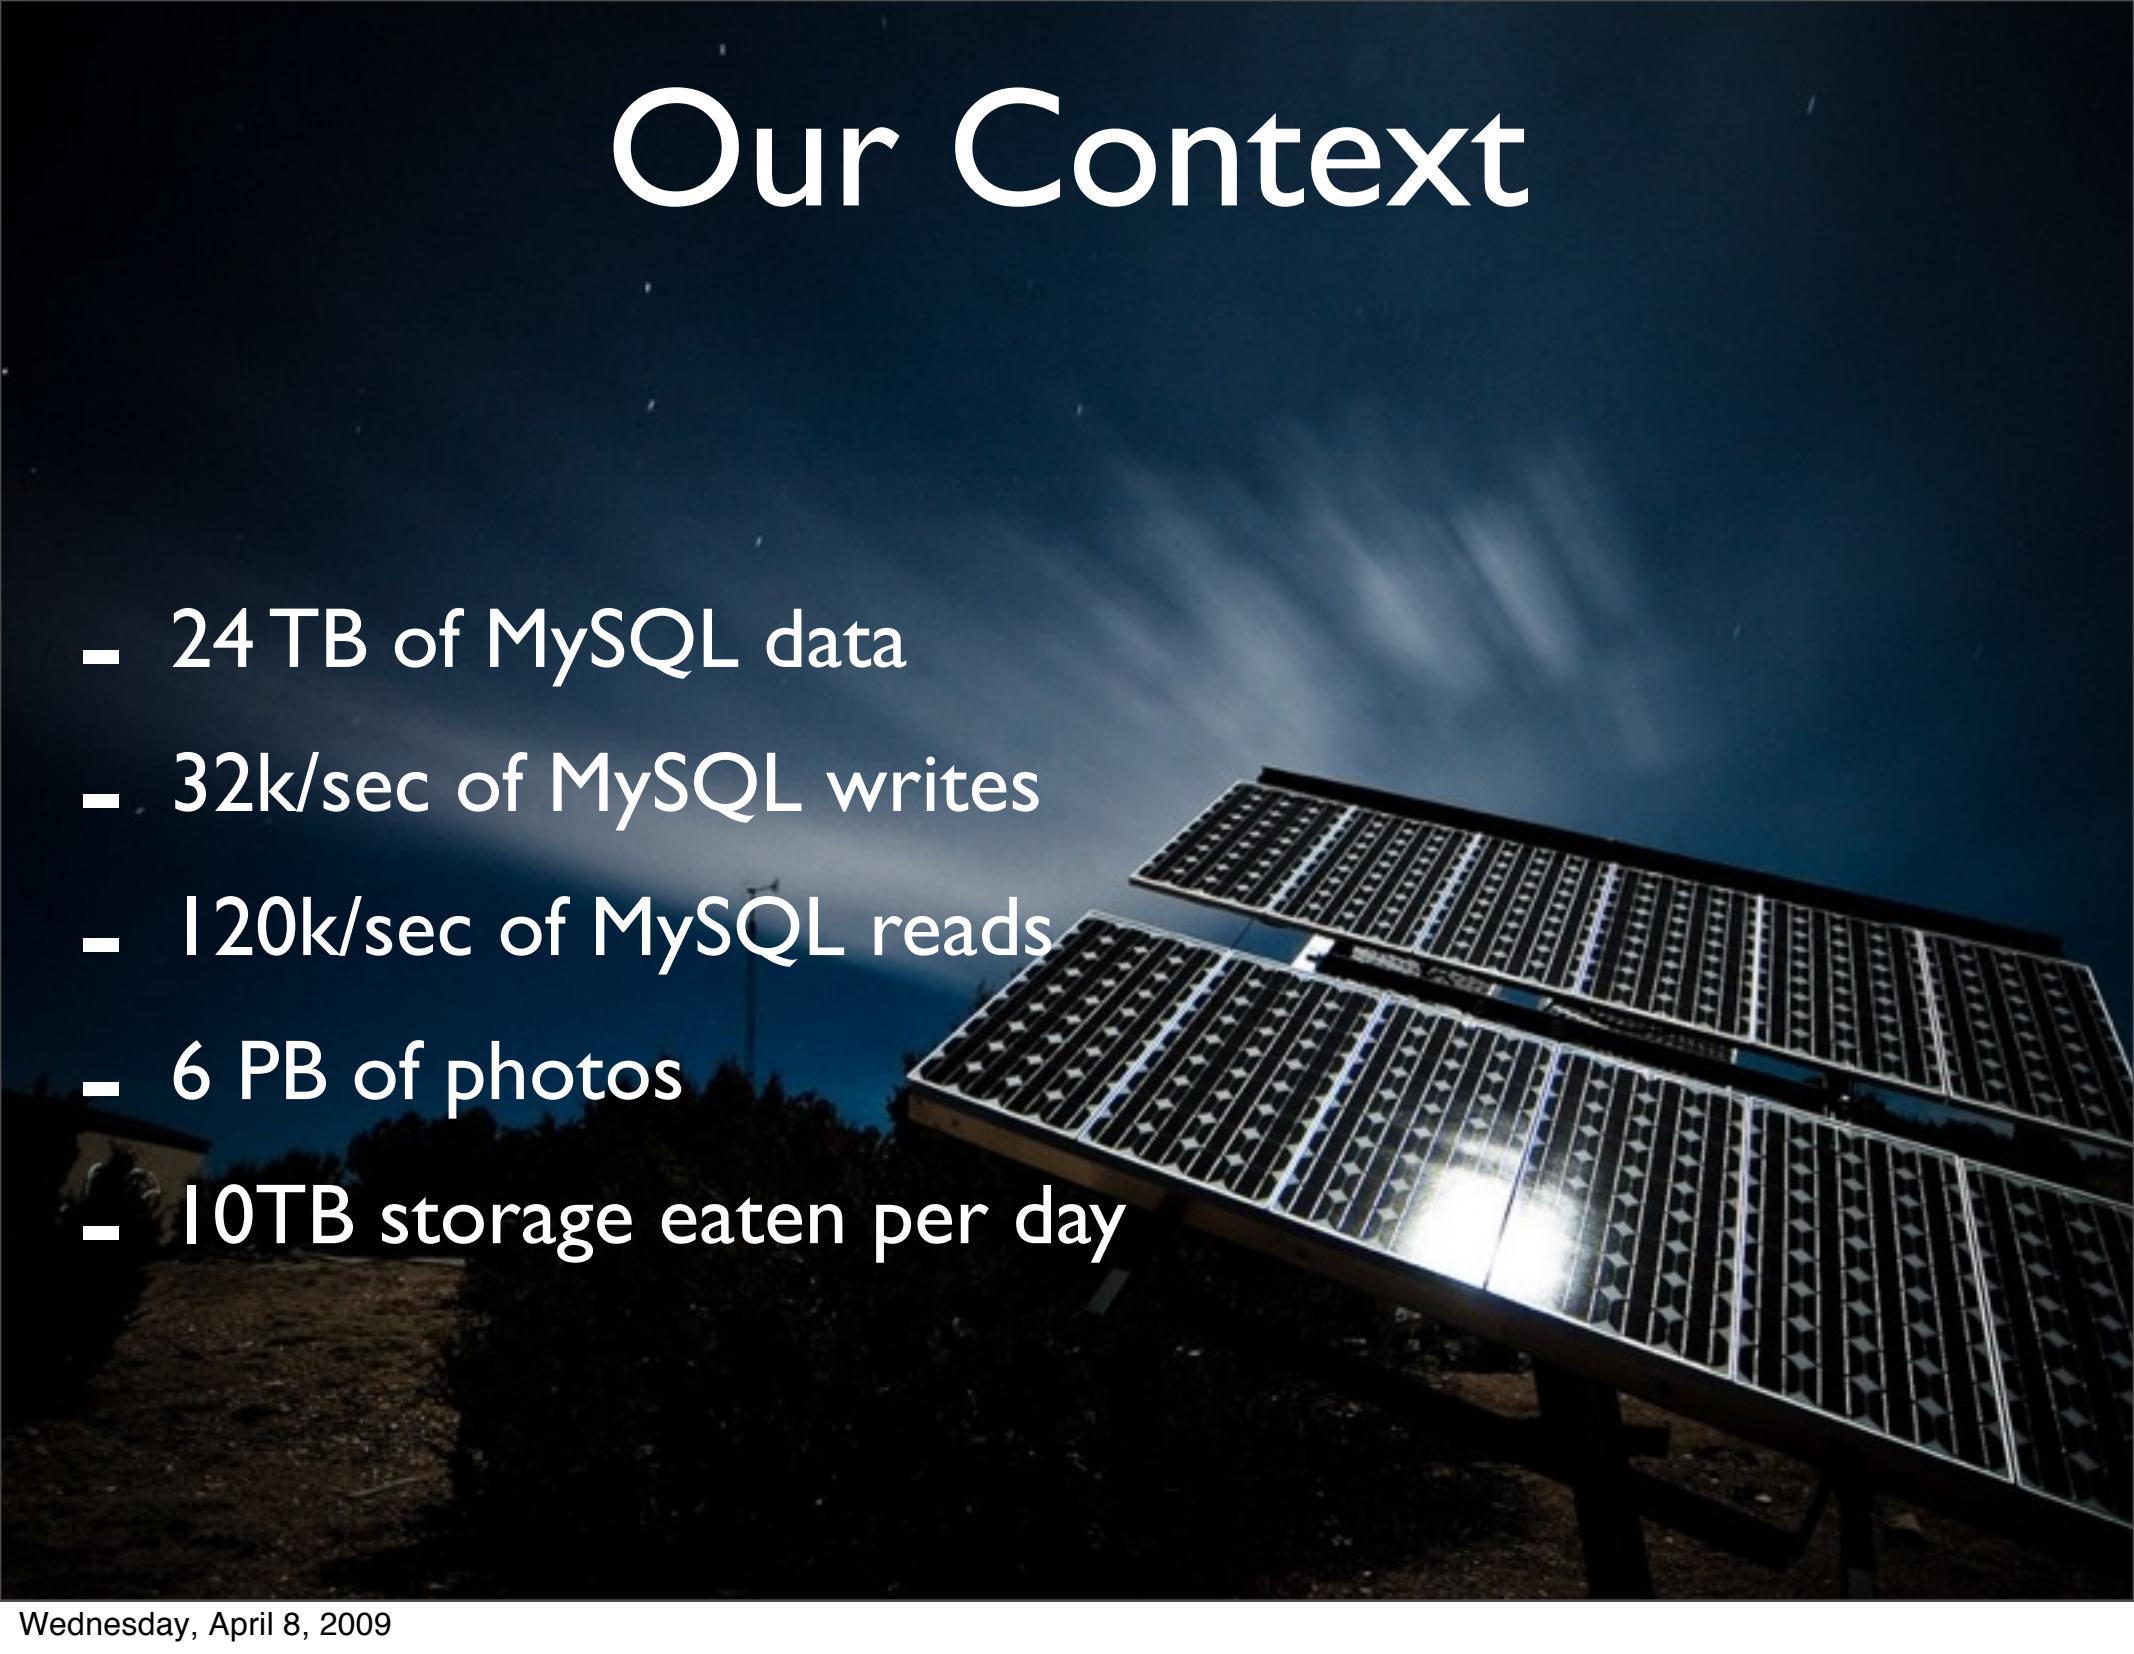

Our Context

- 24 TB of MySQL data
- 32k/sec of MySQL writes
- 120k/sec of MySQL reads
- 6 PB of photos

Our Context

- 24 TB of MySQL data
- 32k/sec of MySQL writes
- 120k/sec of MySQL reads
- 6 PB of photos
- 10TB storage eaten per day

Our Context

- 24 TB of MySQL data
- 32k/sec of MySQL writes
- 120k/sec of MySQL reads
- 6 PB of photos
- 10TB storage eaten per day
- 15,362 service monitors (alerts)

Infrastructure Hacks

Infrastructure Hacks

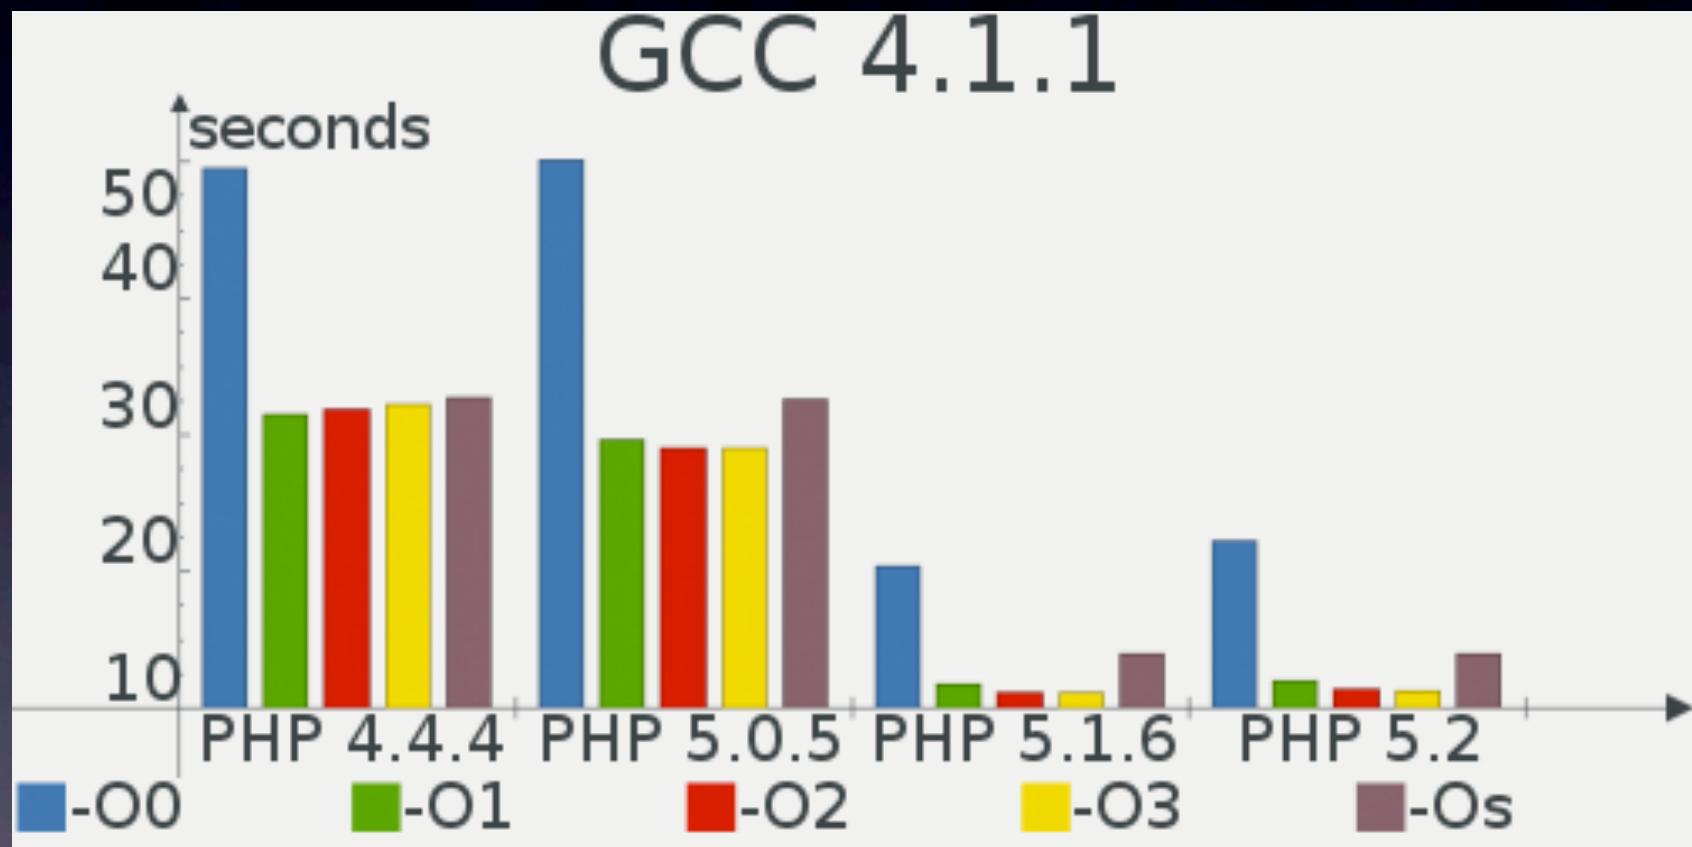

- Examples of what changing software can do
(plain old-fashioned performance tuning)

Infrastructure Hacks

- Examples of what changing software can do
(plain old-fashioned performance tuning)
- Examples of what changing hardware can do
(yay for Mr. Moore!)

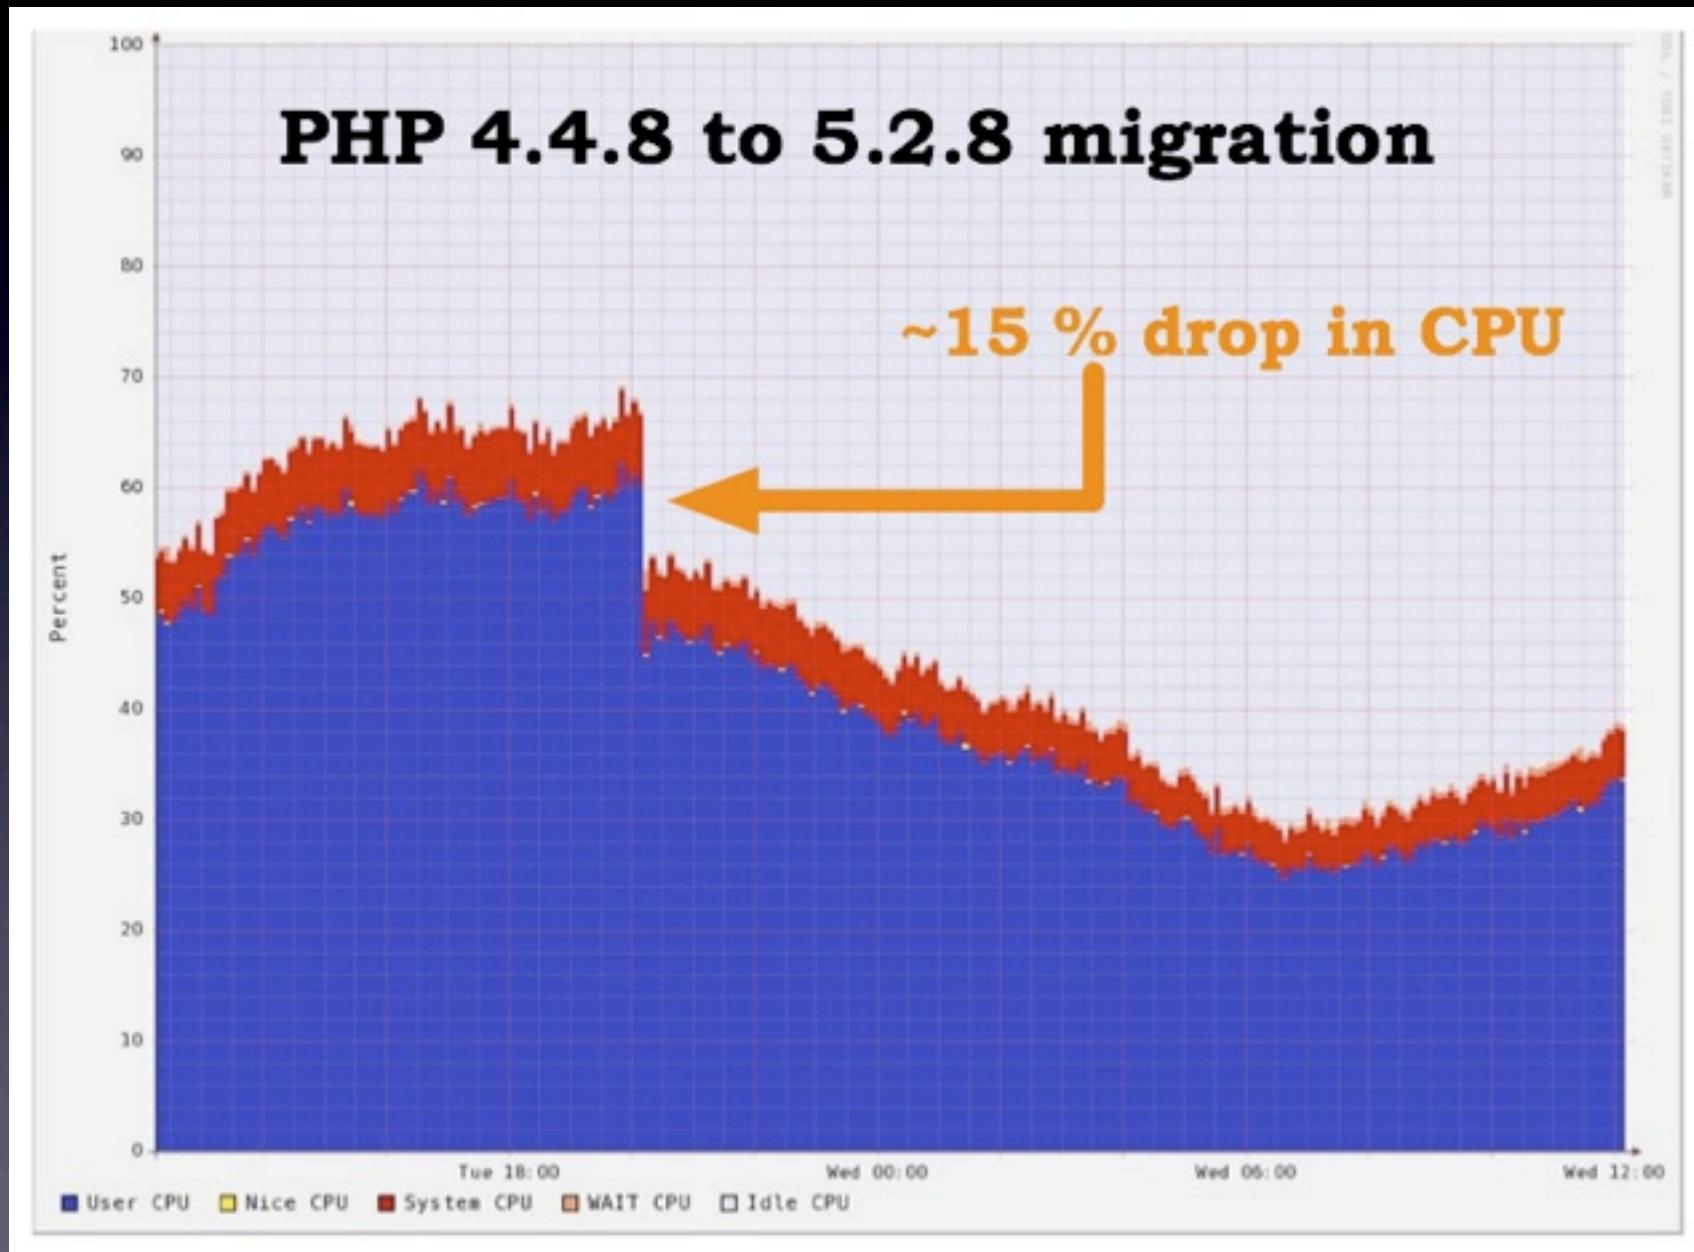

Leaning on compilers

(synthetic PHP benchmarks, not real-world)

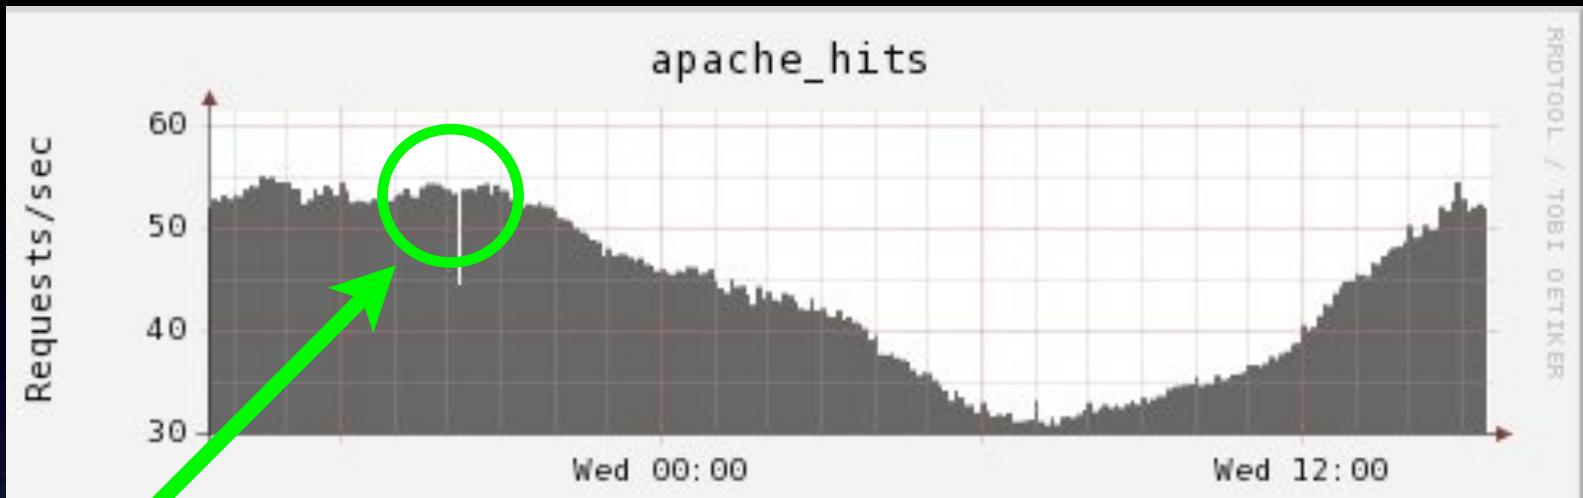

(<http://sebastian-bergmann.de/archives/634-PHP-GCC-ICC-Benchmark.html>)

PHP (*real-world*)

Can now handle more with less

same
taste,
less
filling

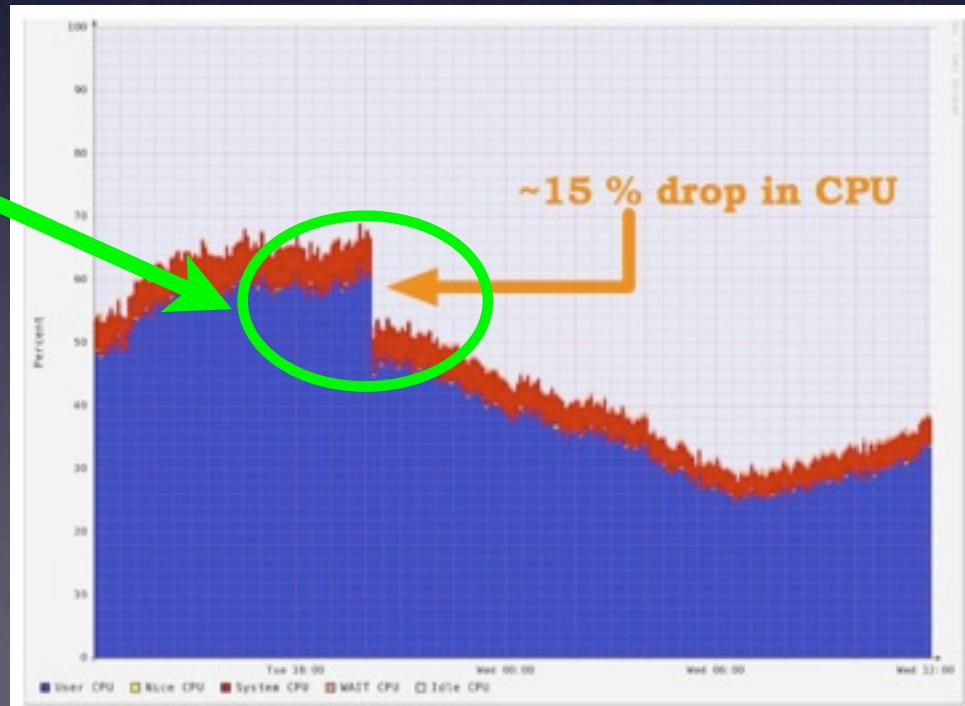

Image Processing

Image Processing

- 2004, Flickr was using ImageMagick for image processing (*version 6.1.9*)

Image Processing

- 2004, Flickr was using ImageMagick for image processing (*version 6.1.9*)
- Changed to GraphicsMagick, about 15% faster at the time (*version 1.1.5*)

Image Processing

- 2004, Flickr was using ImageMagick for image processing (*version 6.1.9*)
- Changed to GraphicsMagick, about 15% faster at the time (*version 1.1.5*)
- Only need a subset of ImageMagick features anyway for our purposes

Image Processing

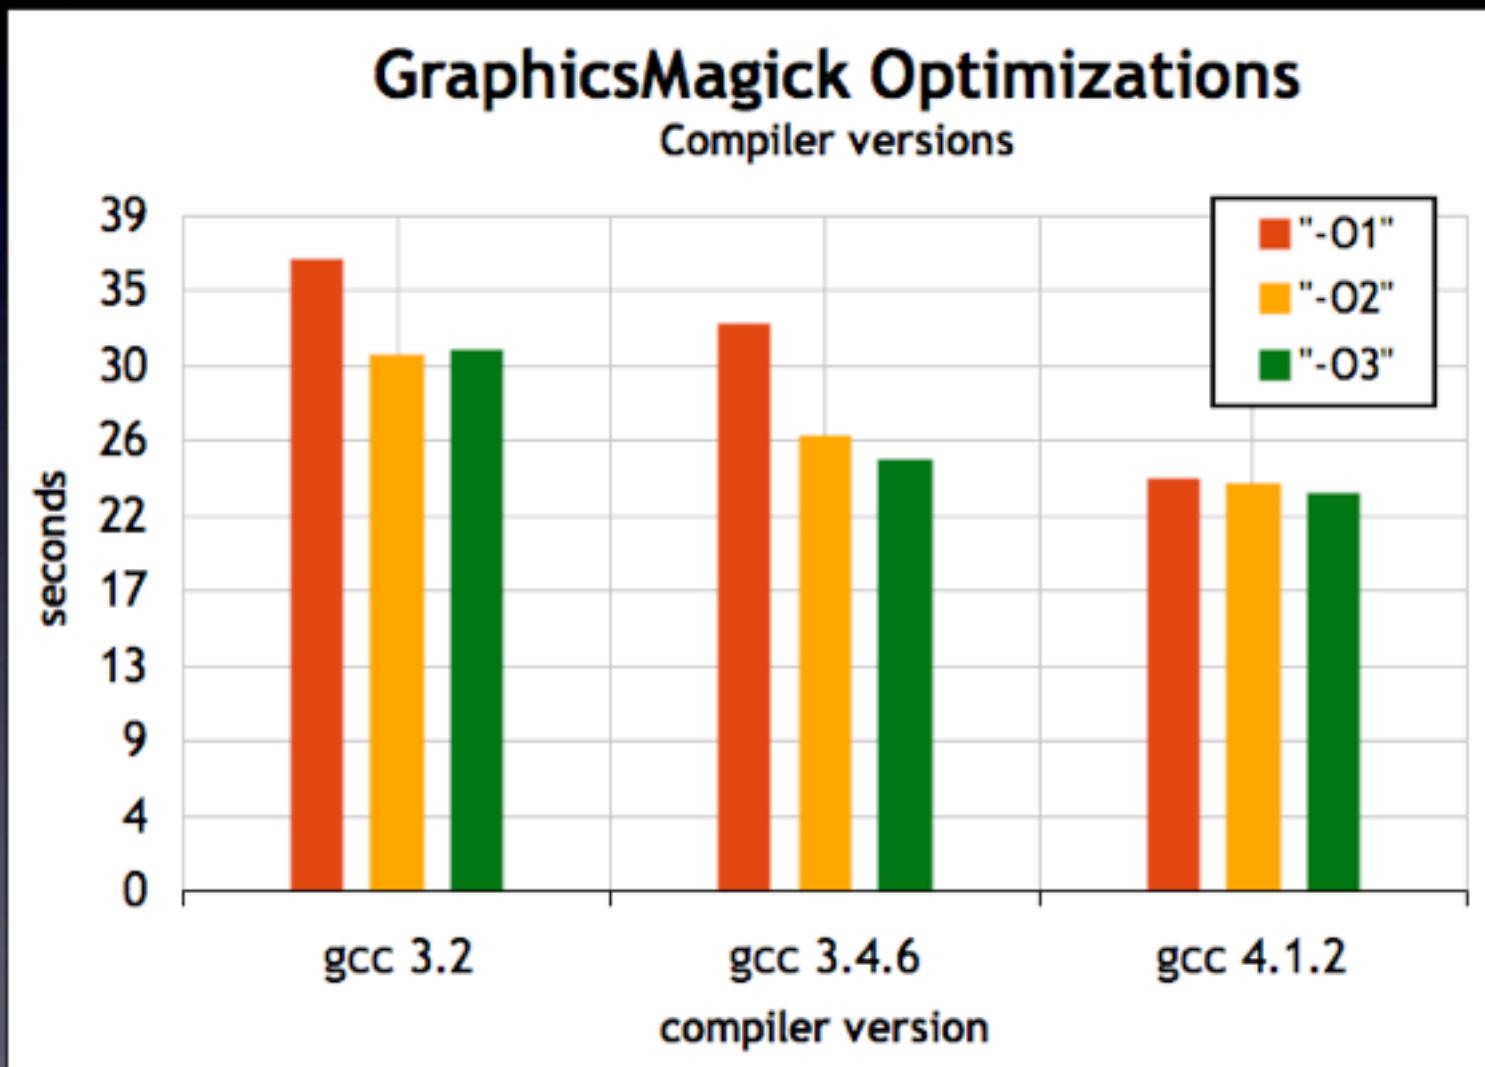

- OpenMP support
(<http://en.wikipedia.org/wiki/Openmp>)
 - Allows parallelization of processing jobs, using multiple cores working on the same image
 - Some algorithms have more parallelization than others

Image Processing

- Test script
 - 7 large-ish DSLR photos
 - Cascade resizing each to 6 smaller sizes, semi-typical for Flickr's workload
 - Each resize processed serially

Image Processing

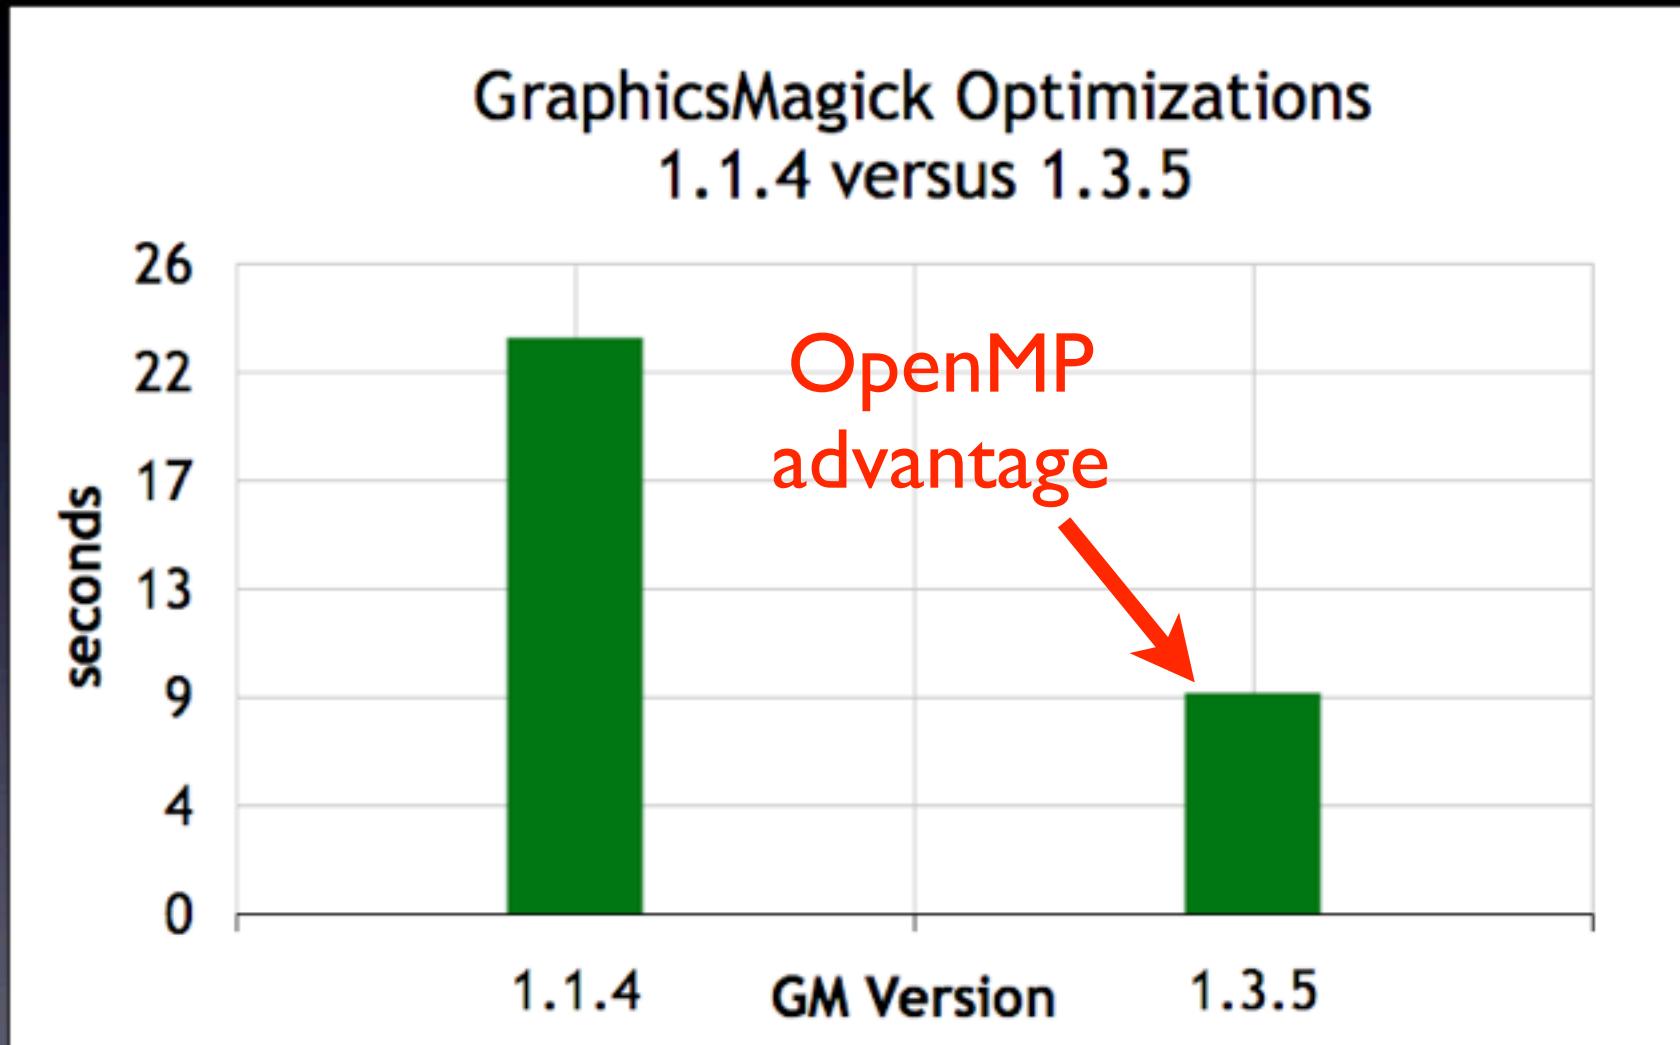

compiler differences

(GM version 1.1.14, non-OpenMP)

Image Processing

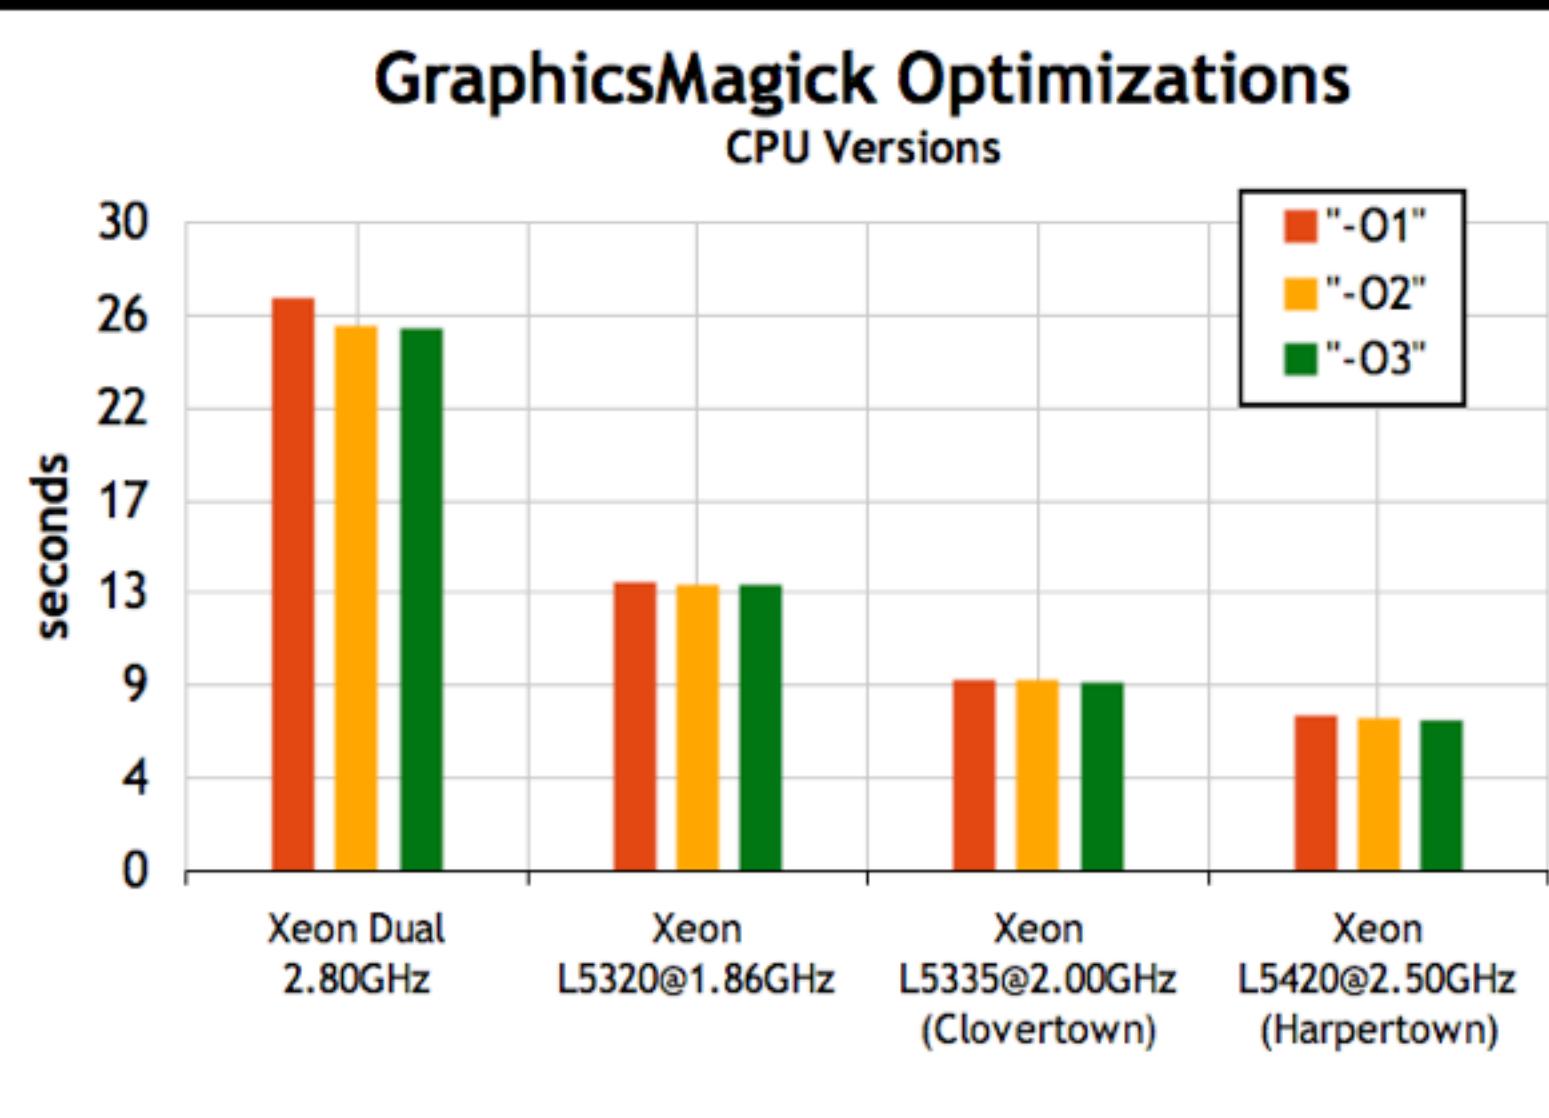

OpenMP differences

(gcc 4.1.2, on quad core Xeon L5335 @ 2.00GHz)

Image Processing

CPU differences

Time

Machine time is cheaper than human time.

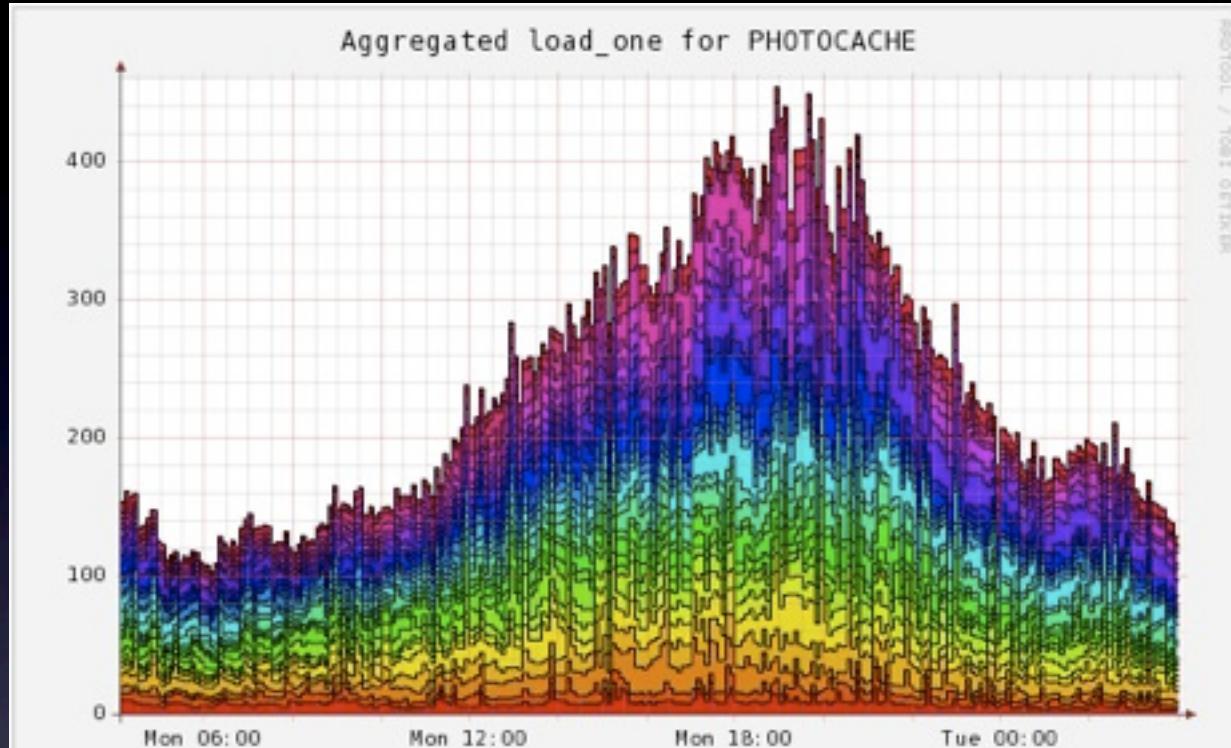

If a failure results in some commands being run to ‘fix’ it, make the machines do it.

(i.e., don’t wake people up for stupid things!)

Aggregate Monitoring

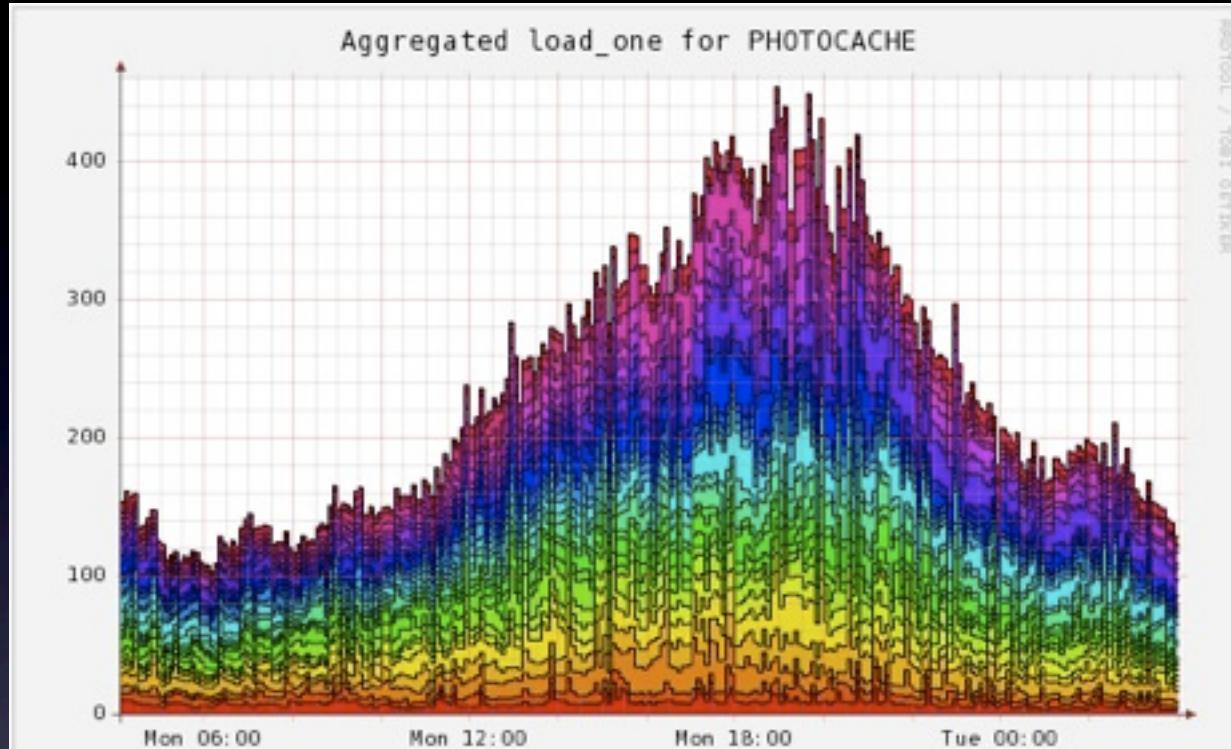

Aggregate Monitoring

Don't care about single nodes, only care about delta change of metrics/faults

- Warn (email) on X % change
- Page (wake up) on Y % change

Aggregate Monitoring

Don't care about single nodes, only care about delta change of metrics/faults

- Warn (email) on X % change
- Page (wake up) on Y % change

High *and* low water marks for some metrics

Self-Healing

Self-Healing

Make service monitoring fix common failure scenarios, notify us later about it.

Self-Healing

Make service monitoring fix common failure scenarios, notify us later about it.

Self-Healing

Make service monitoring fix common failure scenarios, notify us later about it.

Daemons/processes run on machines, will take corrective action under certain conditions, and report back with what they did.

Self-Healing

Make service monitoring fix common failure scenarios, notify us later about it.

Daemons/processes run on machines, will take corrective action under certain conditions, and report back with what they did.

Can greatly reduce your *mean time to recovery* (MTTR)

Basic Apache Example

Apache is a web server that can be used to host static files or dynamic content.

It is a free, open-source software that is widely used around the world.

Apache has many features, such as mod_rewrite, which allows you to rewrite URLs.

Apache also has a built-in SSL/TLS support, which allows you to encrypt your website's traffic.

Apache is a powerful web server that can be used to host static files or dynamic content.
