

# Datacenter Computing with Apache Mesos

**BigData DC Meetup @AddThis**  
**2014-04-15**

**Paco Nathan**  
<http://liber118.com/pxn/>  
[@pacoid](https://twitter.com/pacoid)

[meetup.com/bigdatadc/events/172610652/](https://www.meetup.com/bigdatadc/events/172610652/)

# A Big Idea

**Have you heard about  
“data democratization” ? ? ?**

**⇒ making data available  
throughout more of the organization**

**Have you heard about  
“data democratization” ???**

⇒ **making data available  
throughout more of the organization**

**Then how would you handle  
“cluster democratization” ???**

⇒ **making data+resources available  
throughout more of the organization**

Have you heard about  
“data democratization” ???

⇒ making data available  
**In other words,** throughout more of the organization  
**how to remove silos...**

Then how would you handle  
“cluster democratization” ???

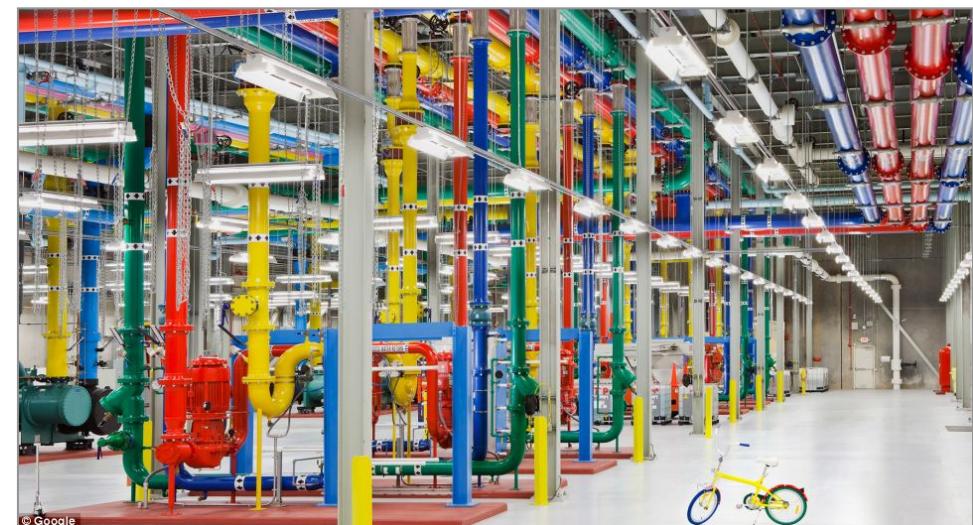

⇒ making data+resources available  
throughout more of the organization

# Lessons from Google

# Datacenter Computing

Google has been doing *datacenter computing* for years, to address the complexities of large-scale data workflows:

- leveraging the modern kernel: isolation in lieu of VMs
- “most (>80%) jobs are batch jobs, but the majority of resources (55–80%) are allocated to service jobs”
- mixed workloads, multi-tenancy
- relatively high utilization rates
- JVM? not so much...
- reality: scheduling batch is simple; scheduling services is hard/expensive

# The Modern Kernel: Top Linux Contributors...

(a) Single-path.

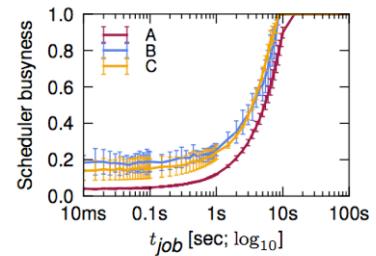

(b) Multi-path.

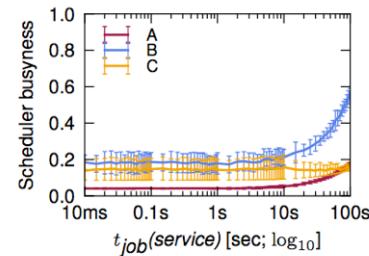

(c) Shared state.

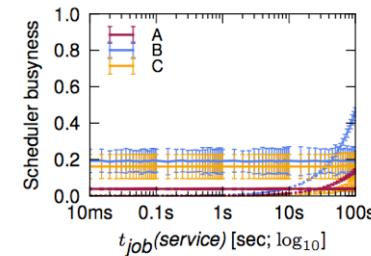

**Figure 5:** Schedulers' job wait time, as a function of  $t_{job}$  in the monolithic single-path case,  $t_{job(service)}$  in the monolithic multi-path and shared-state cases. The SLO (horizontal bar) is 30s.

(a) Single-path.

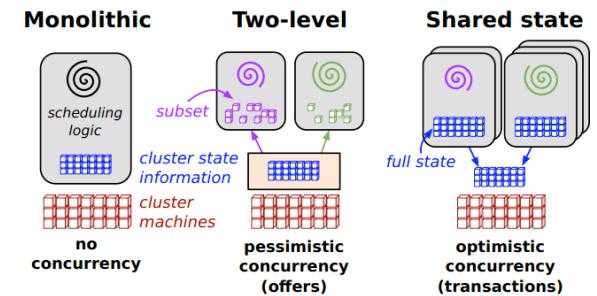

(b) Multi-path.

(c) Shared state.

**Figure 6:** Schedulers' busyness, as a function of  $t_{job}$  in the monolithic single-path case,  $t_{job(service)}$  in the monolithic multi-path and shared-state cases. The value is the median daily busyness over the 7-day experiment, and error bars are one  $\pm$  median absolute deviation (MAD), i.e. the median deviation from the median value, a robust estimator of typical value dispersion.

## **Google describes the business case...**

*Taming Latency Variability*

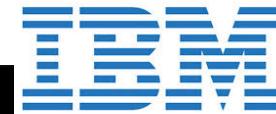

Jeff Dean

[plus.google.com/u/0/+ResearchatGoogle/posts/CIdPhQhcDRv](https://plus.google.com/u/0/+ResearchatGoogle/posts/CIdPhQhcDRv)

## Commercial OS Cluster Schedulers

- IBM Platform Symphony
- Microsoft Autopilot

**Arguably, some grid controllers  
are quite notable in-category:**

- Univa Grid Engine (formerly SGE)
- Condor
- etc.

**Emerging  
at Berkeley**

# Beyond Hadoop

Hadoop – an open source solution for fault-tolerant parallel processing of batch jobs at scale, based on commodity hardware... however, other priorities have emerged for the **analytics lifecycle**:

- apps require integration beyond Hadoop
- multiple topologies, mixed workloads, multi-tenancy
- significant disruptions in h/w cost/performance curves
- higher utilization
- lower latency
- highly-available, long running services
- more than “Just JVM” – e.g., Python growth

# Just No Getting Around It

“There's Just No Getting Around It: You're Building a Distributed System”

Mark Cavage

ACM Queue (2013-05-03)

[queue.acm.org/detail.cfm?id=2482856](http://queue.acm.org/detail.cfm?id=2482856)

key takeaways on architecture:

- decompose the business application into discrete services on the boundaries of fault domains, scaling, and data workload
- make as many things as possible stateless
- when dealing with state, deeply understand CAP, latency, throughput, and durability requirements

*“Without practical experience working on successful—and failed—systems, most engineers take a "hopefully it works" approach and attempt to string together off-the-shelf software, whether open source or commercial, and often are unsuccessful at building a resilient, performant system. In reality, building a distributed system requires a methodical approach to requirements along the boundaries of failure domains, latency, throughput, durability, consistency, and desired SLAs for the business application at all aspects of the application.”*

# MESOS

[Getting Started](#)[Documentation](#)[Downloads](#)[Community](#)

Apache Software Foundation ▾ / Apache Mesos

Apache Mesos is a cluster manager that provides efficient resource isolation and sharing across distributed applications. Mesos can run Hadoop, Jenkins, Spark, Aurora, and other applications on a dynamically shared pool of nodes.

[Download Mesos 0.18.0](#)

or learn how to [get started](#)

## Mesos Adopters

**Chris Fry, SVP of Engineering at Twitter**

"Mesos is the cornerstone of our elastic compute infrastructure -- it's how we build all our new services and is critical for Twitter's continued success at scale. It's one of the primary keys to our data center efficiency."

## News

- April 10, 2014 - Mesos 0.18.0 is released! See the [release notes](#) and [blog post announcement](#) for more details.
- March 28, 2014 - Mesos Community

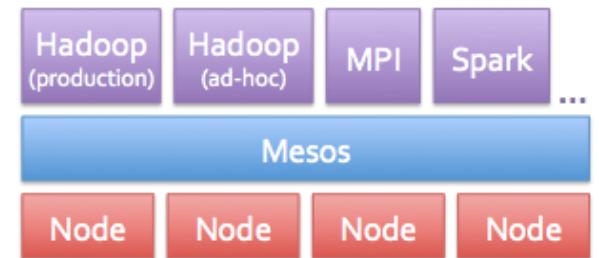

# Mesos – open source datacenter computing

*a common substrate for cluster computing*

[mesos.apache.org](http://mesos.apache.org)

heterogenous assets in your datacenter or cloud  
made available as a homogenous set of resources

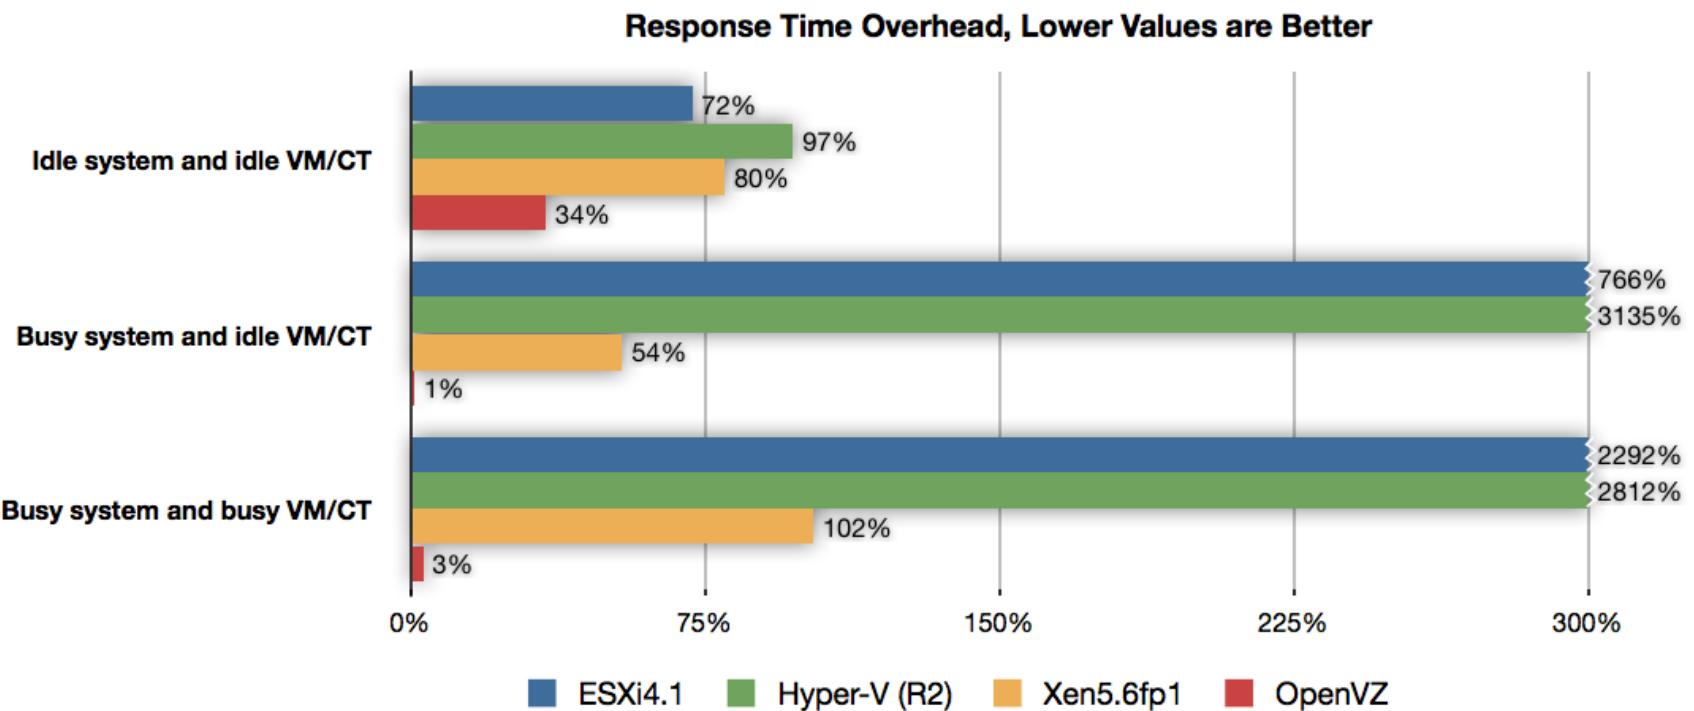

- top-level Apache project
- scalability to 10,000s of nodes
- obviates the need for virtual machines
- isolation (pluggable) for CPU, RAM, I/O, FS, etc.
- fault-tolerant leader election based on Zookeeper
- APIs in **C++, Java/Scala, Python, Go, Erlang, Haskell**
- web UI for inspecting cluster state
- available for Linux, OpenSolaris, Mac OSX

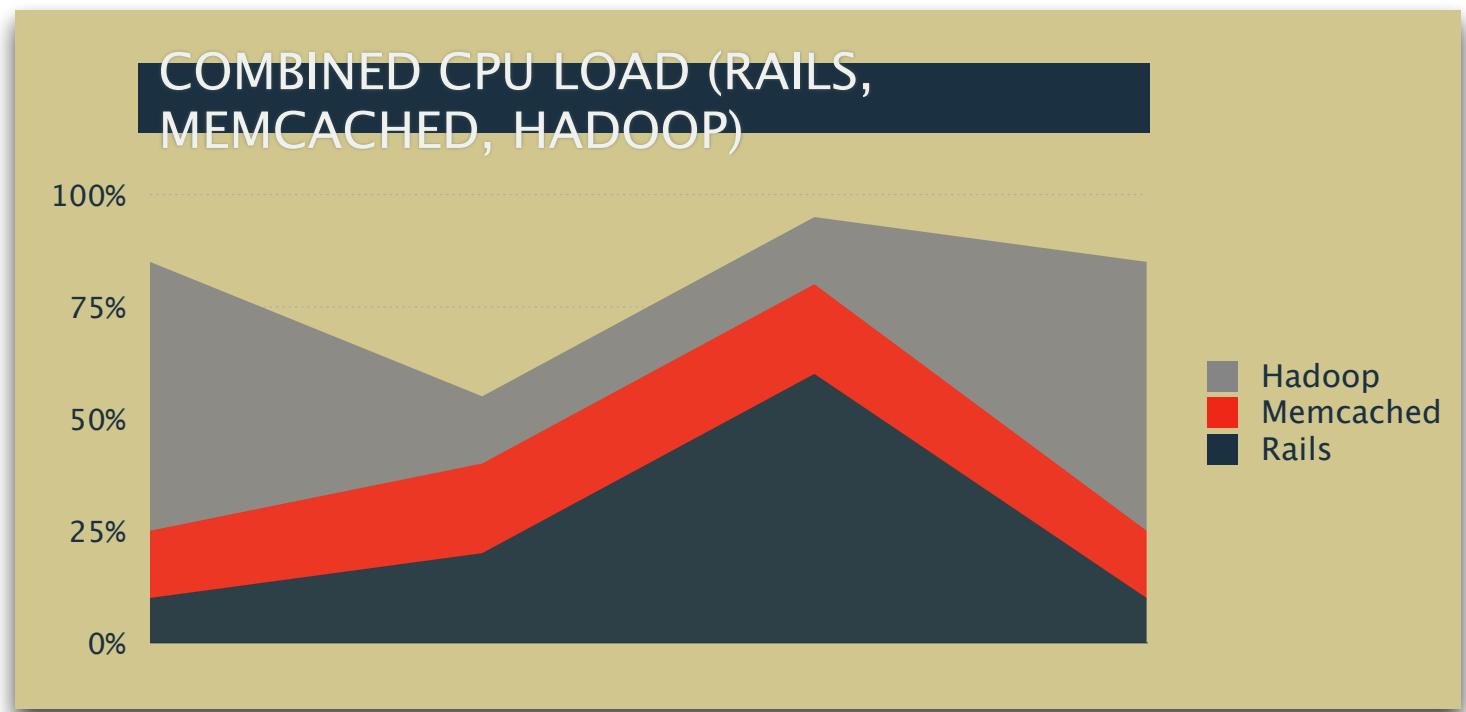

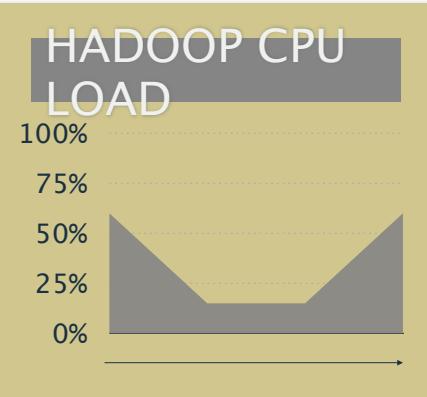

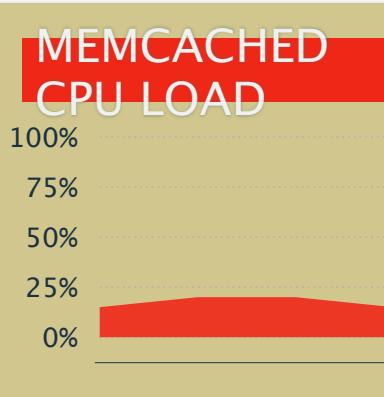

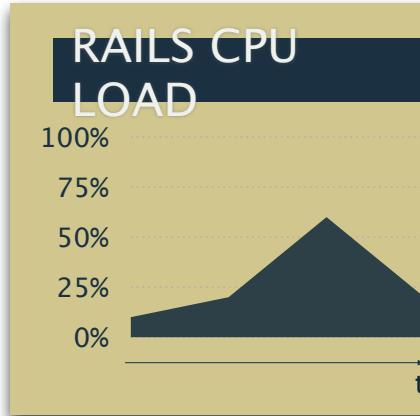

# What are the costs of Virtualization?

benchmark type	OpenVZ improvement
mixed workloads	210%-300%
LAMP (related)	38%-200%
I/O throughput	200%-500%
response time	order magnitude

*more pronounced  
at higher loads*

# What are the costs of Single Tenancy?

# Arguments for Datacenter Computing

rather than running several specialized clusters, each at relatively low utilization rates, instead run many mixed workloads

obvious benefits are realized in terms of:

- scalability, elasticity, fault tolerance, performance, utilization
- reduced equipment capex, Ops overhead, etc.
- reduced licensing, eliminating need for VMs or potential vendor lock-in

subtle benefits – arguably, more important for Enterprise IT:

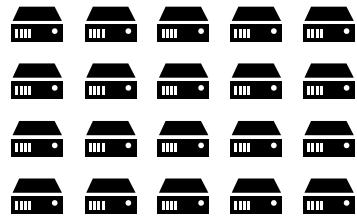

- reduced time for engineers to ramp up new services at scale
- reduced latency between batch and services, enabling new high ROI use cases
- enables Dev/Test apps to run safely on a Production cluster

# Analogies and Architecture

# Prior Practice: Dedicated Servers

## DATACENTER

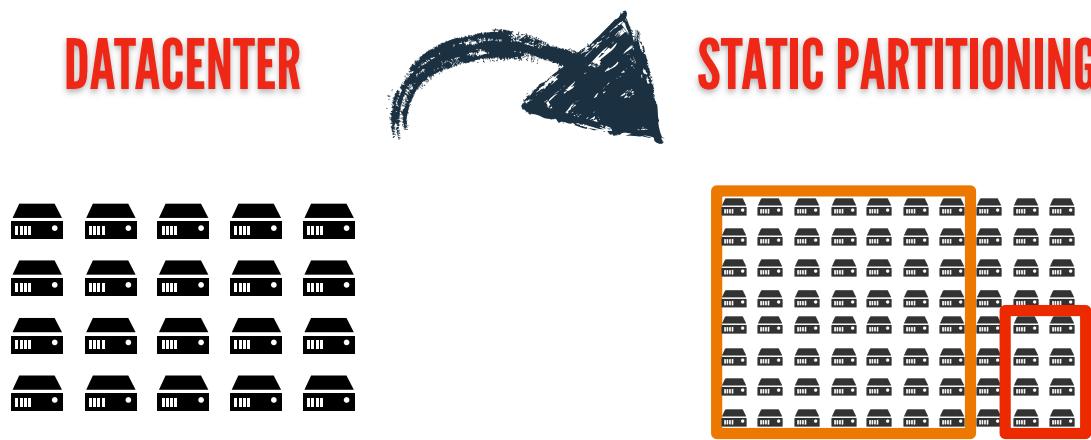

- *low utilization rates*
- *longer time to ramp up new services*

# Prior Practice: Virtualization

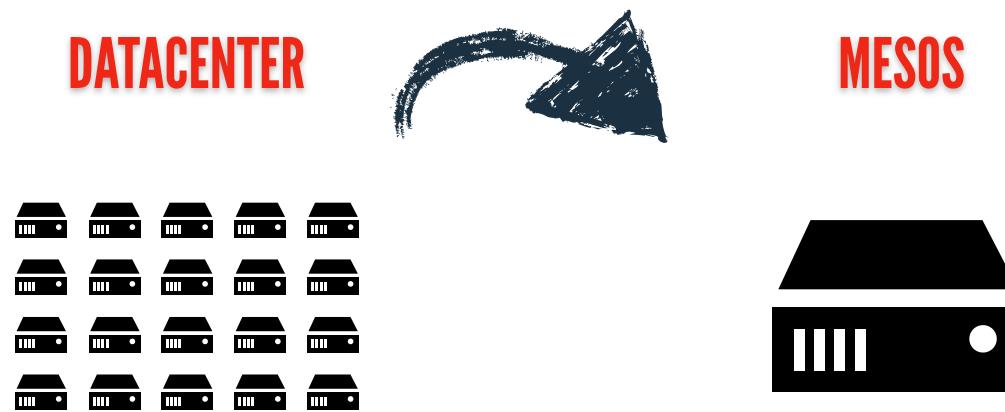

- even *more machines to manage*
- substantial *performance decrease due to virtualization*
- *VM licensing costs*

# Prior Practice: Static Partitioning

- even *more machines to manage*
- substantial *performance decrease due to virtualization*
- *VM licensing costs*
- *failures make static partitioning more complex to manage*

# Mesos: One Large Pool of Resources

*“We wanted people to be able to program  
for the datacenter just like they program  
for their laptop.”*

Ben Hindman

# Frameworks Integrated with Mesos

*Continuous Integration:*  
**Jenkins, GitLab**

*Big Data:*  
**Hadoop, Spark, Storm,  
Kafka**

*Python workloads:*  
**DPark, Exelixi**

*Meta-Frameworks / HA Services:*  
**Aurora, Marathon**

*Orchestration:*  
**Singularity**

*Distributed Cron:*  
**Chronos**

*Data Storage:*  
**ElasticSearch, Cassandra,  
Hypertable**

*Containers:*  
**Docker, Deimos**

*Parallel Processing:*  
**Chapel, MPI**

**Fault-tolerant distributed systems...**

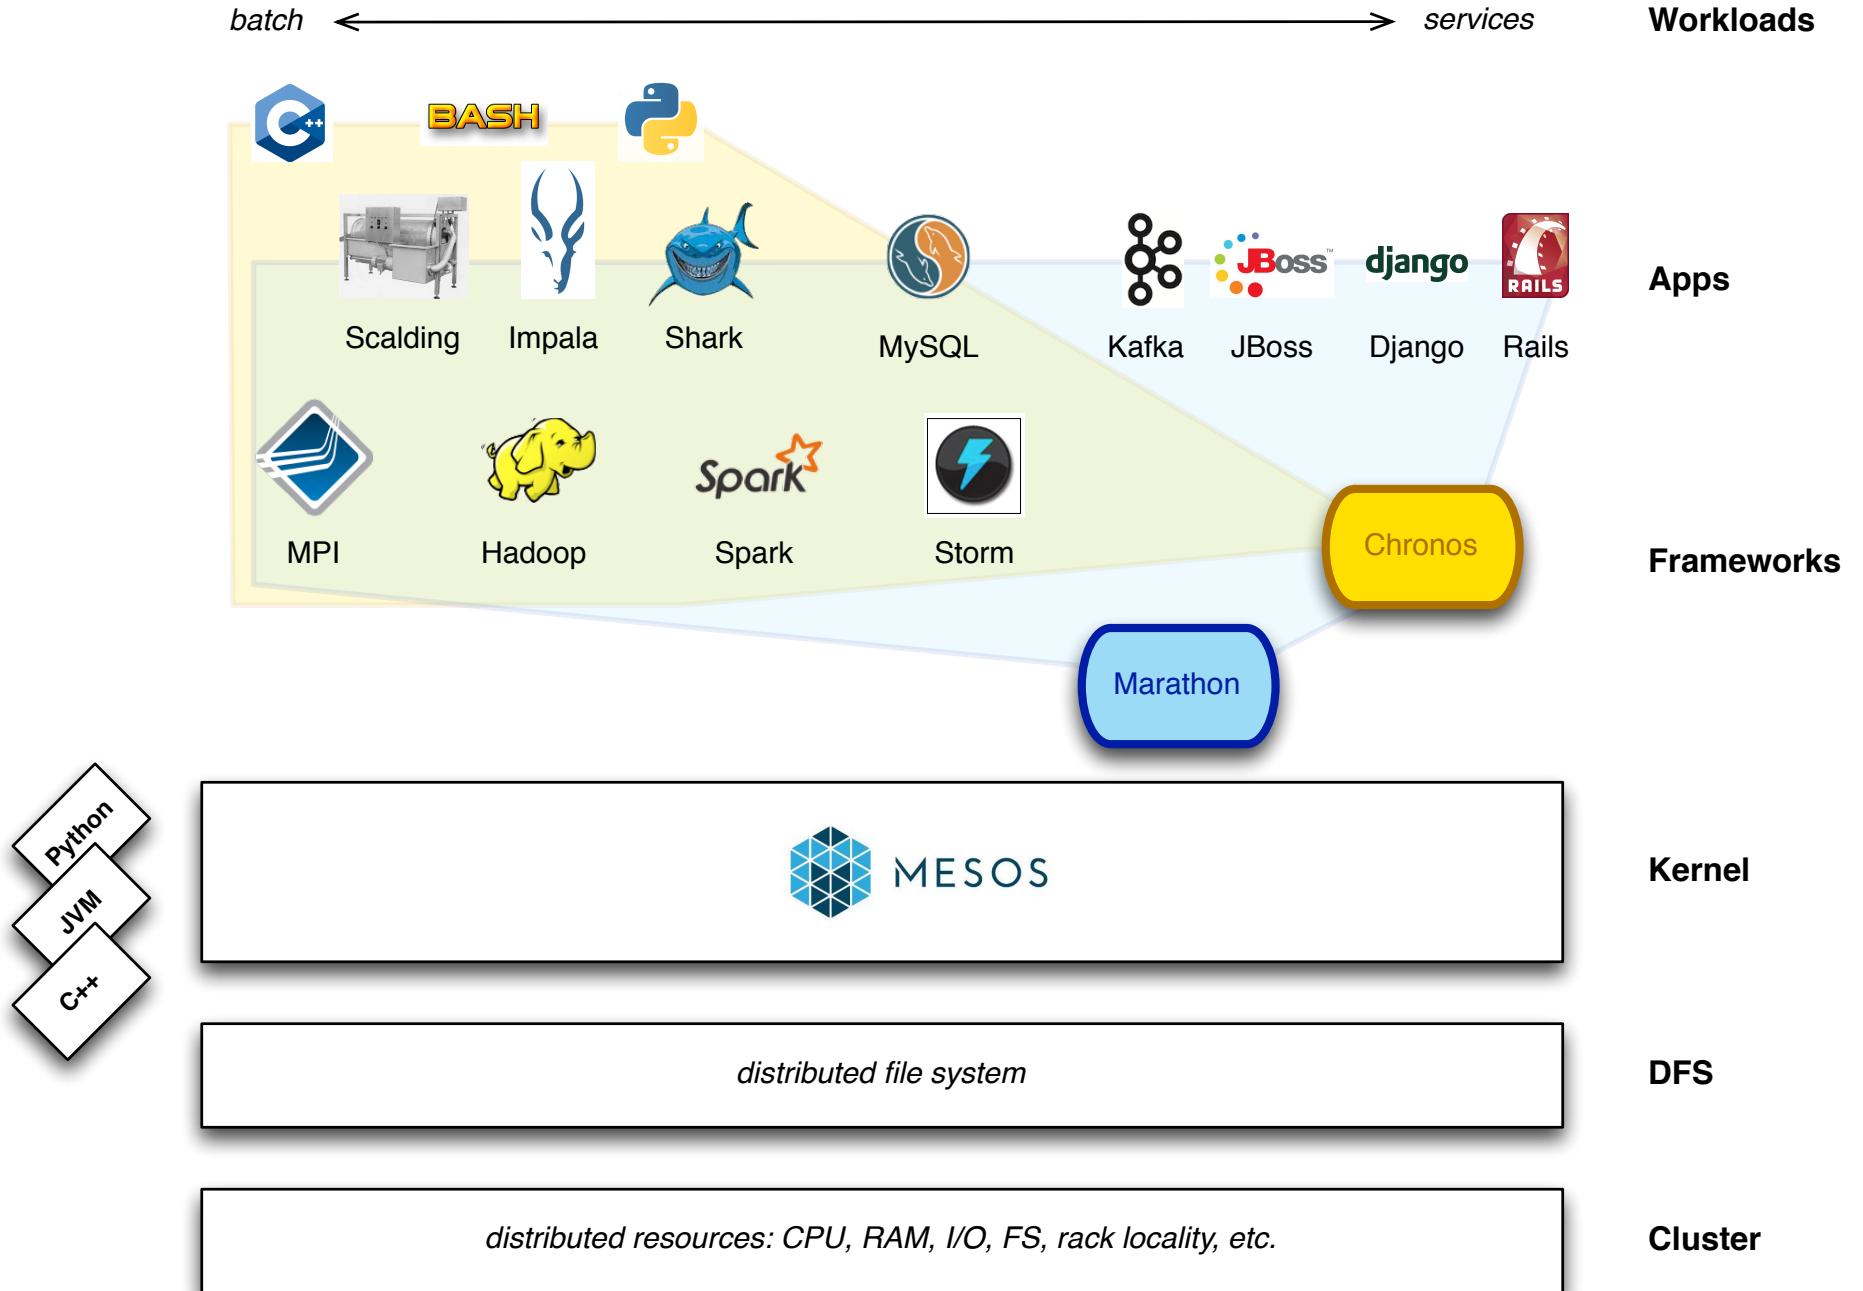

**...written in 100-300 lines of  
C++, Java/Scala, Python, Go, etc.**

**...building blocks, if you will**

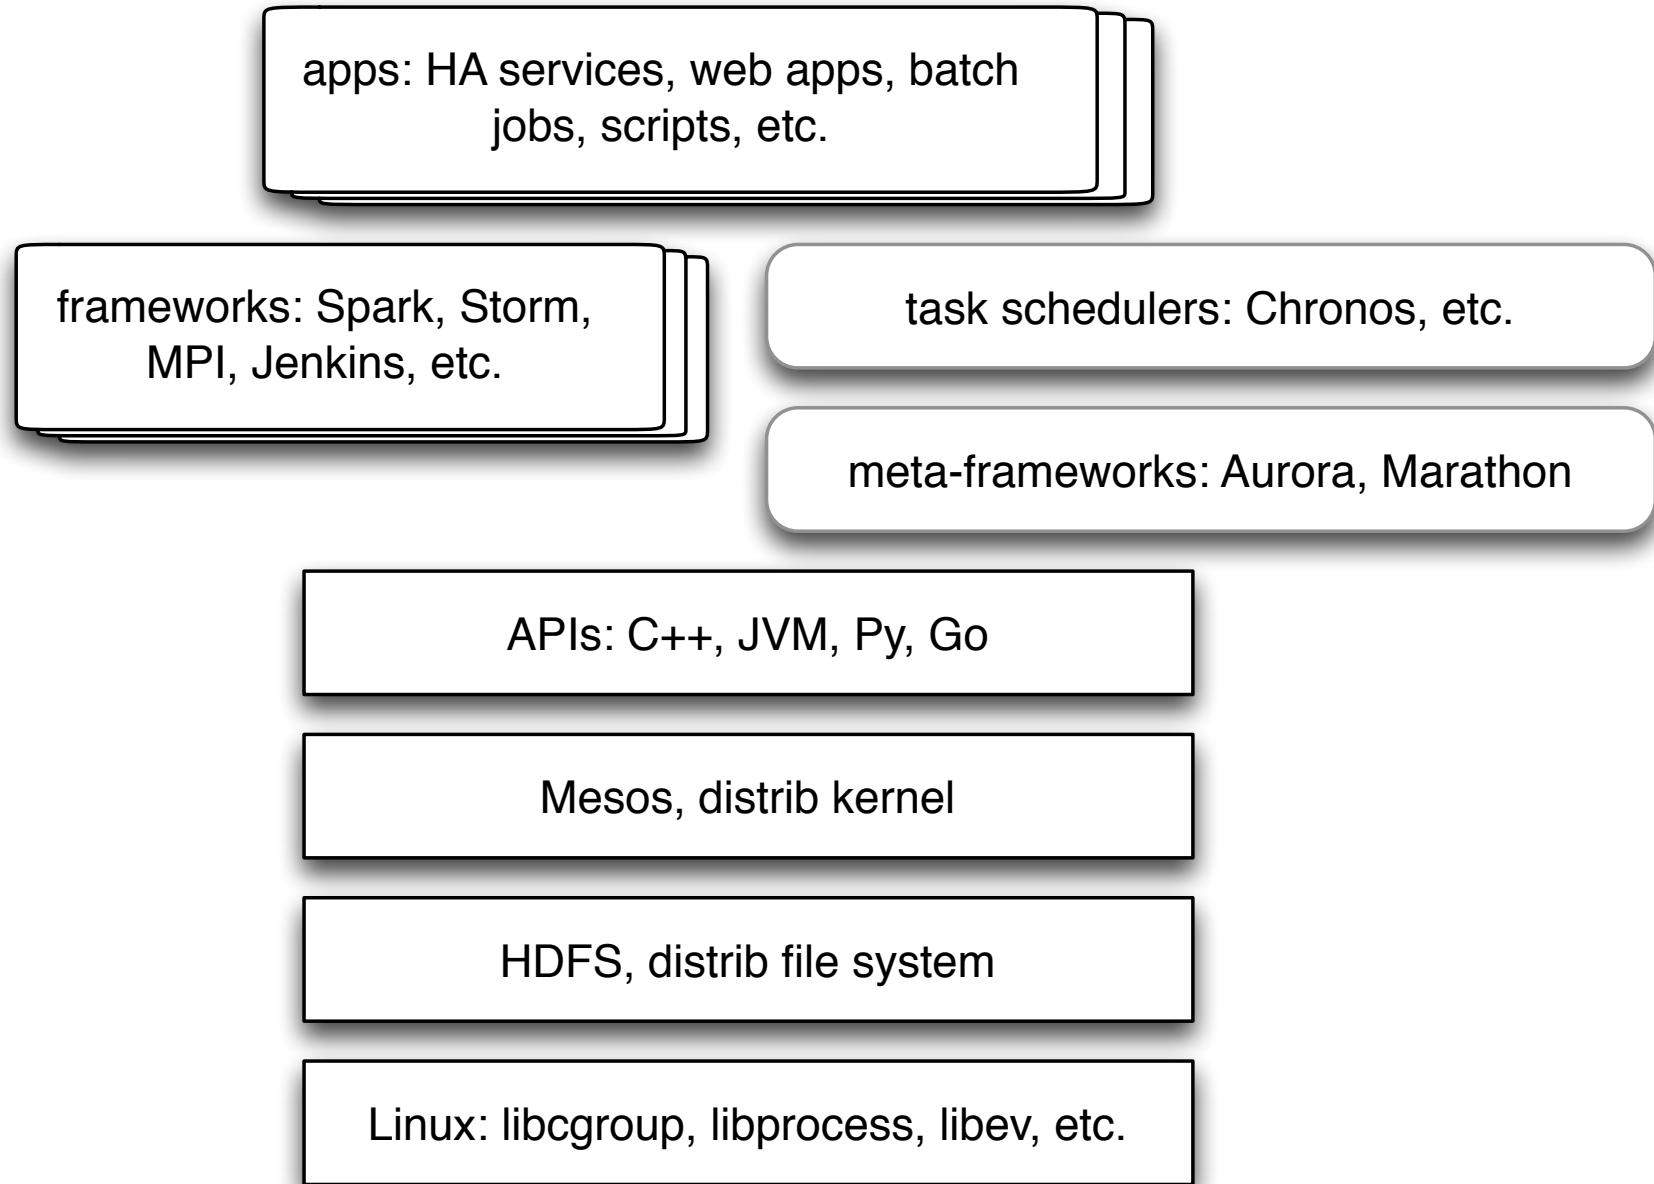

**Q: required lines of network code?**

**A: probably none**

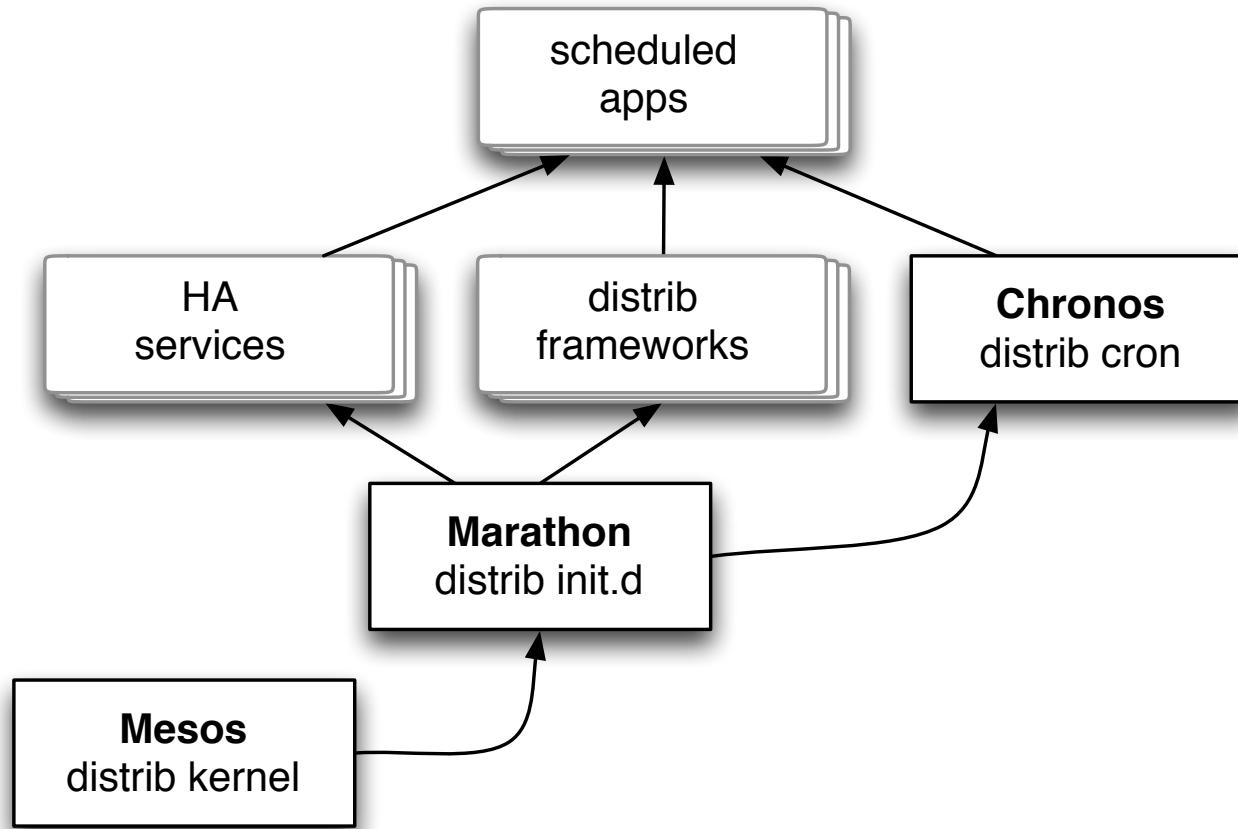

# Mesos – architecture

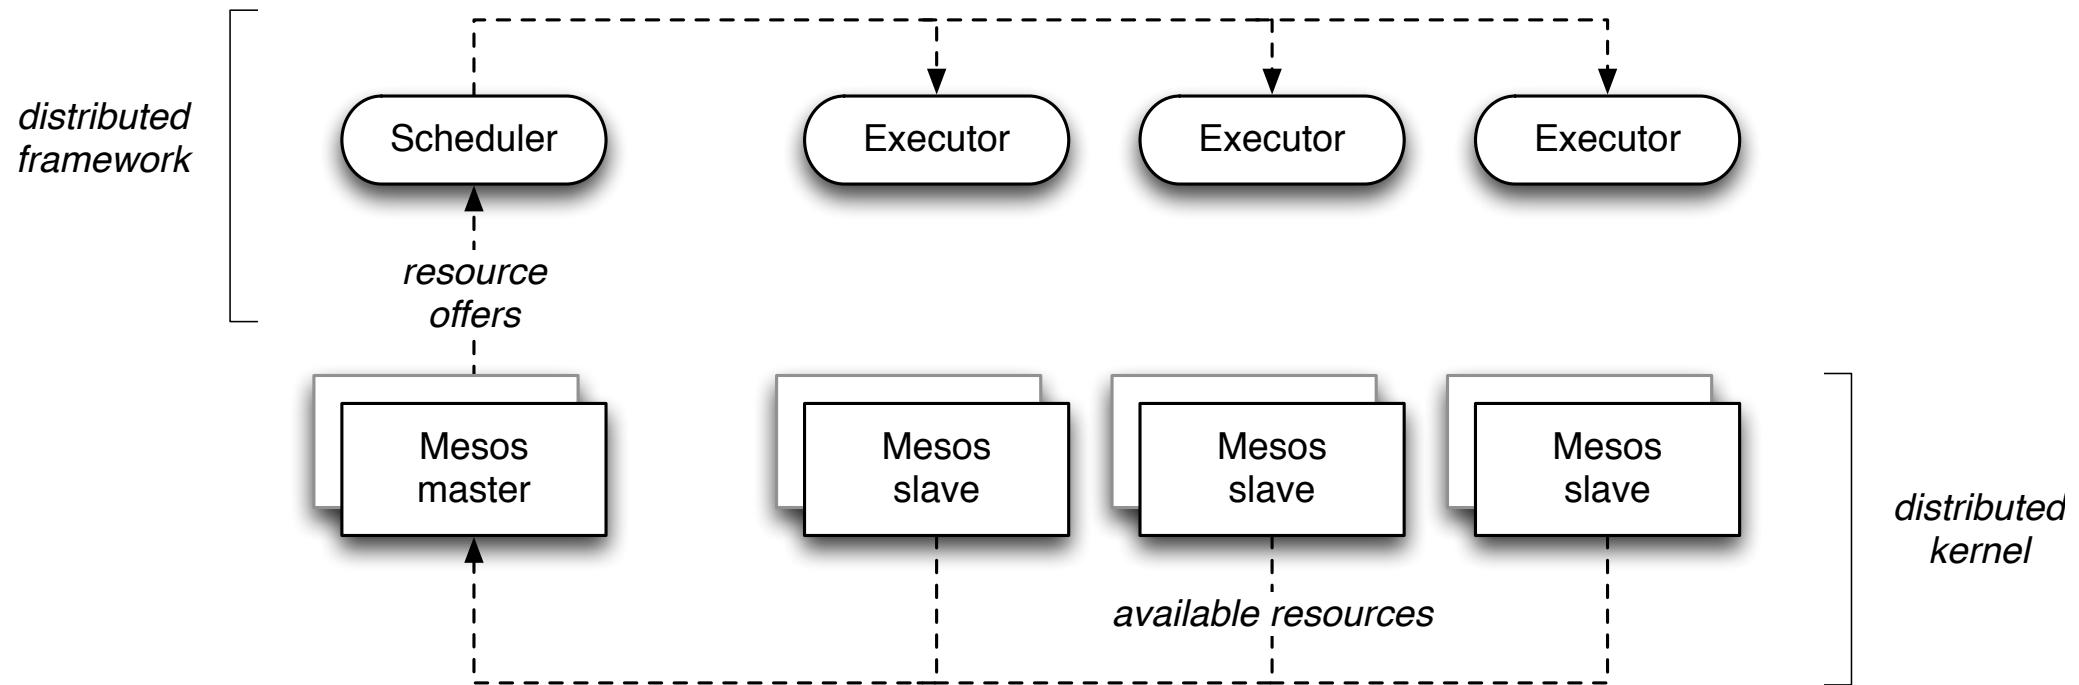

# Mesos – architecture

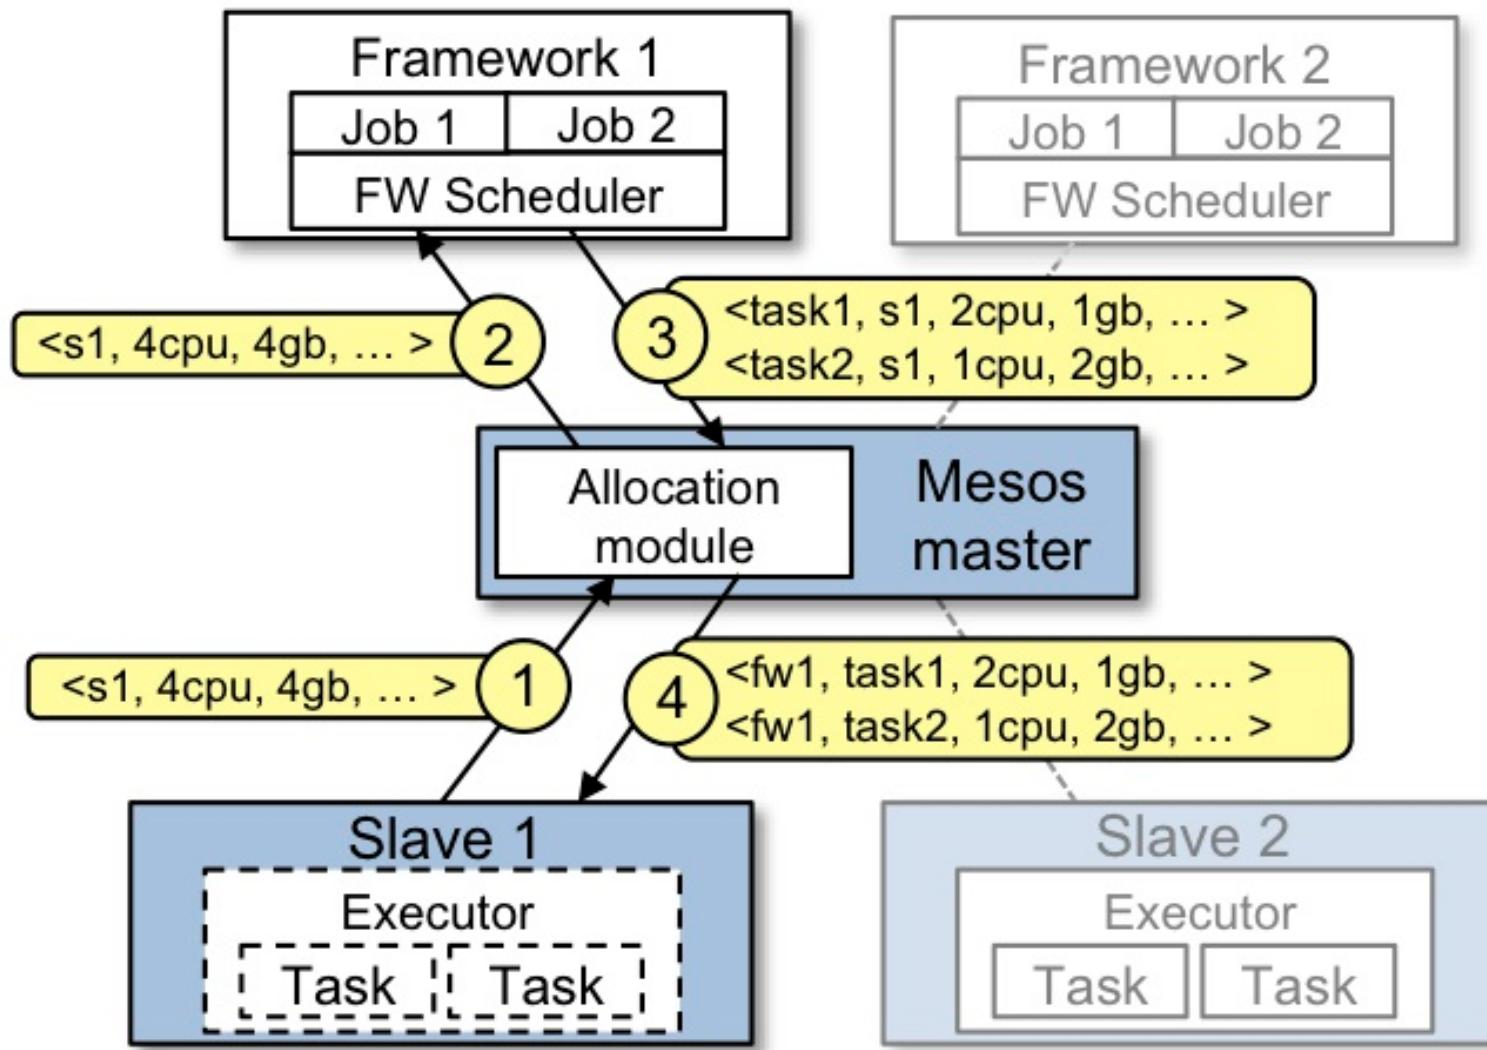

# Mesos – dynamics

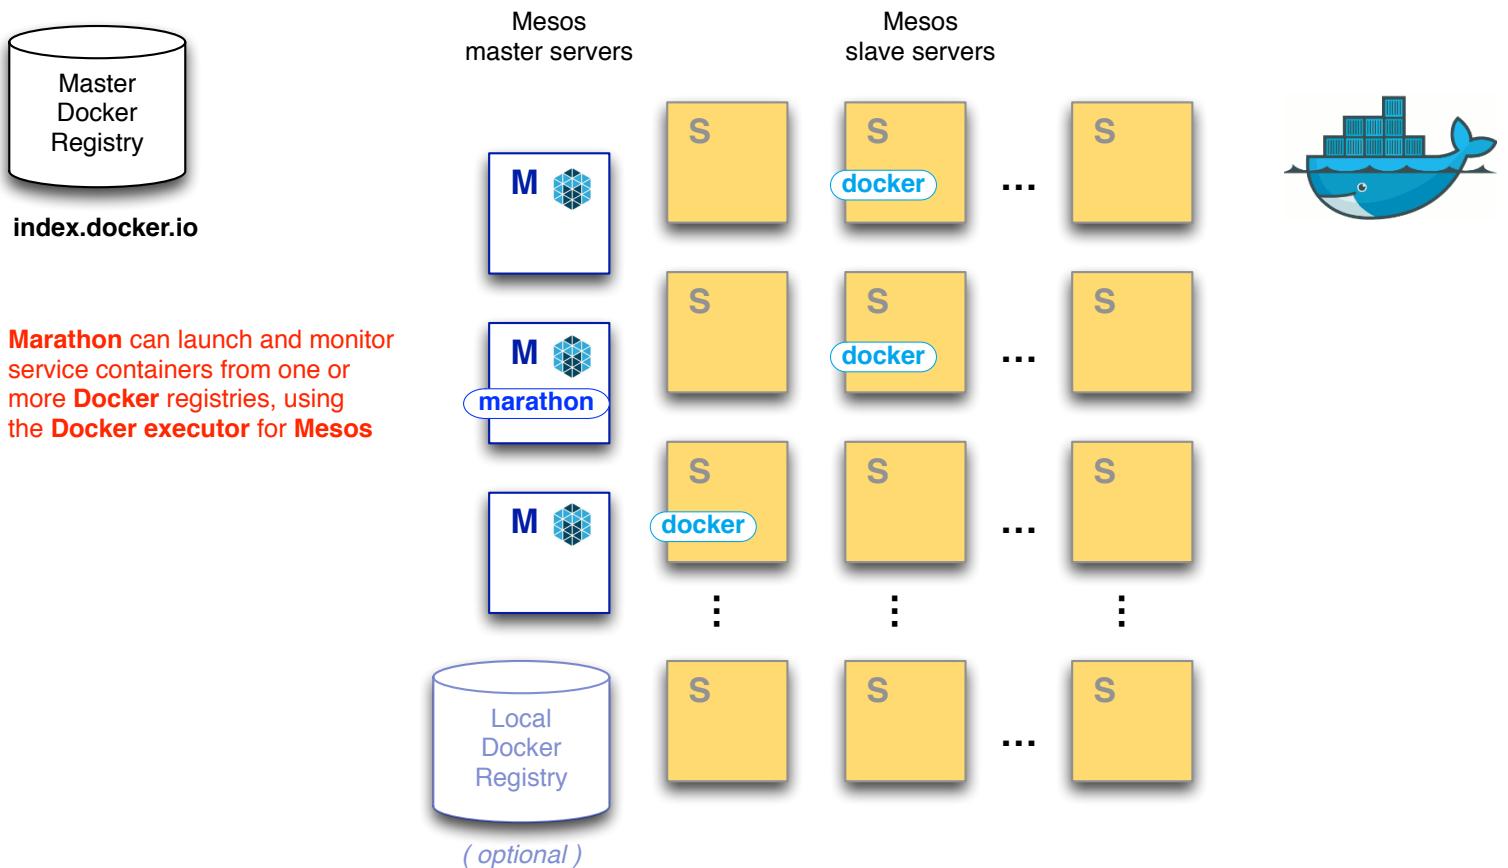

# Mesos – dynamics

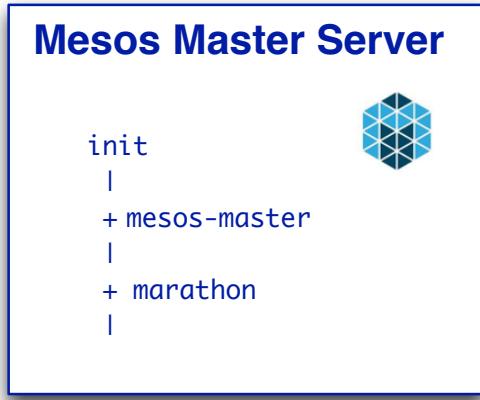

## Example: Resource Offer in a Two-Level Scheduler

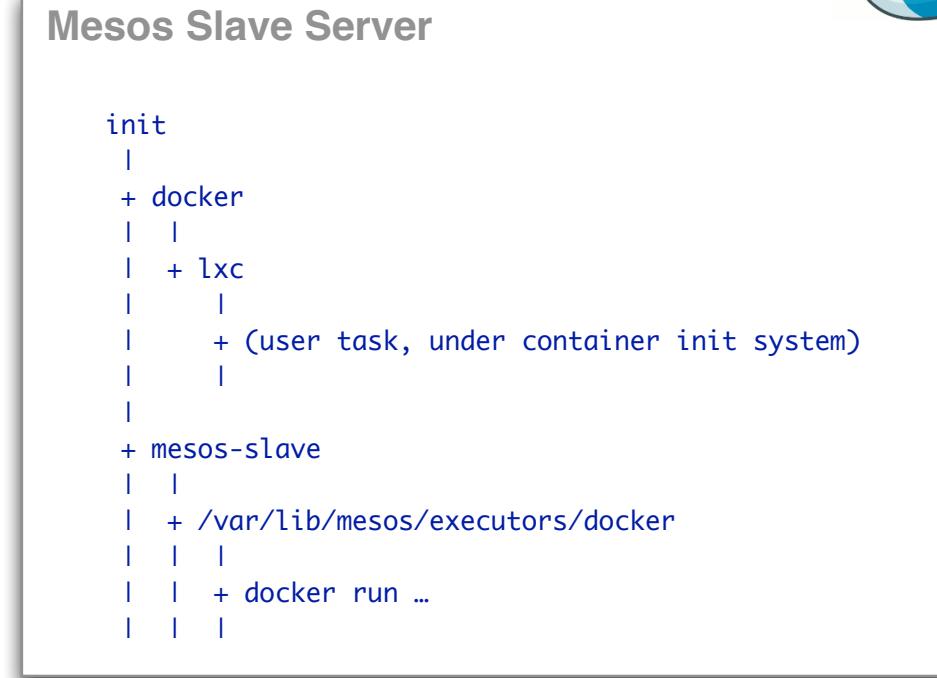

# Example: Docker on Mesos

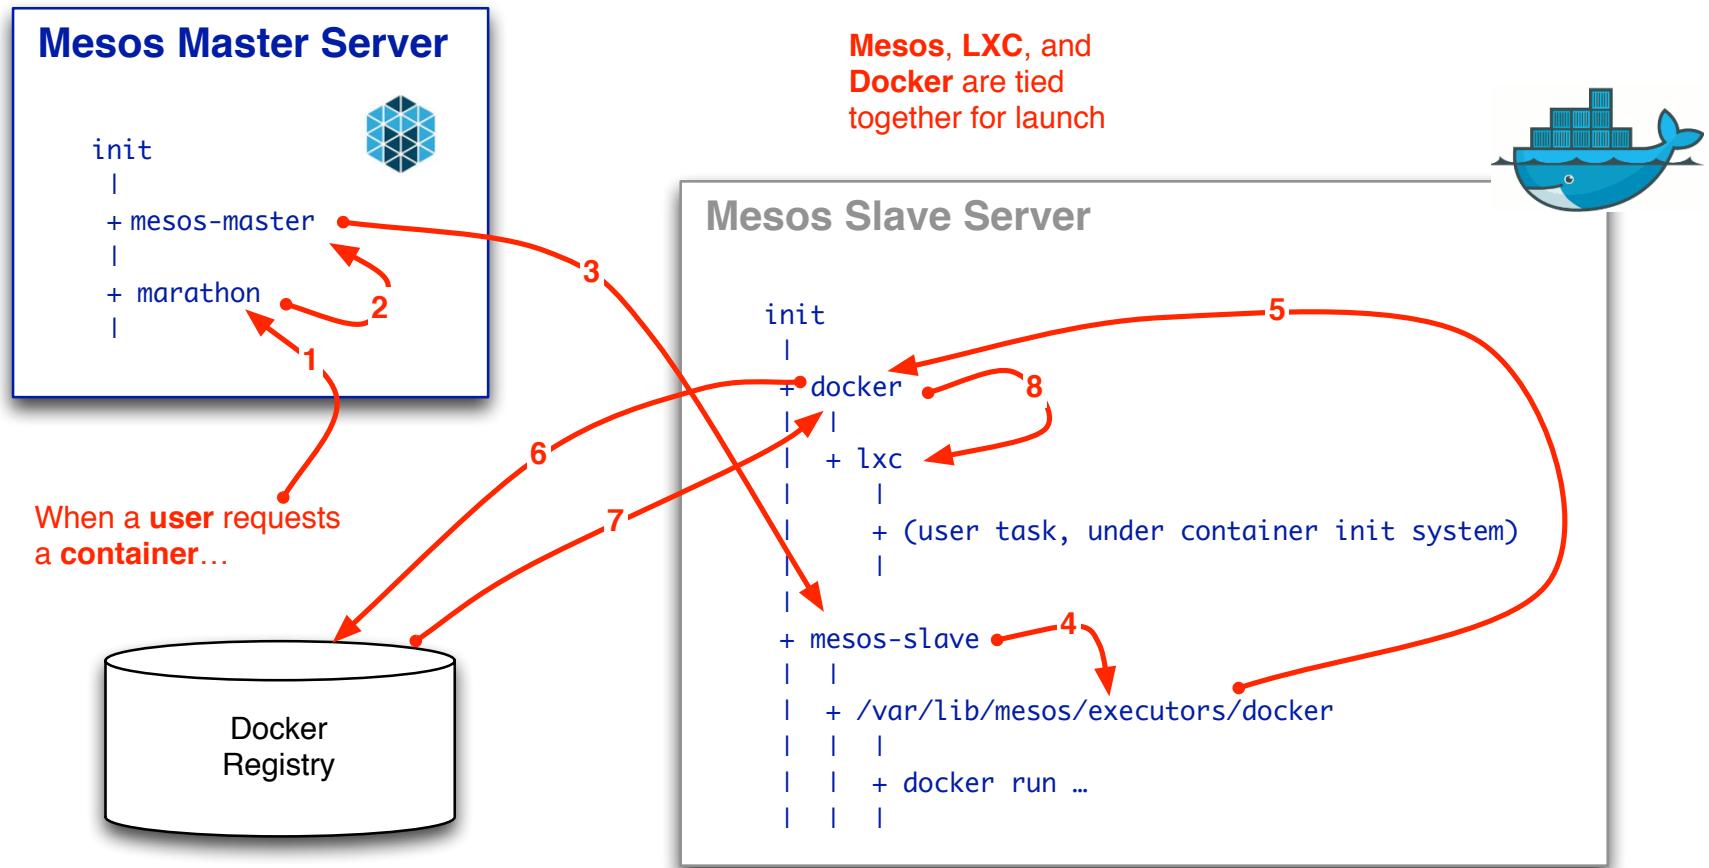

# Example: Docker on Mesos

The **executor**, monitored by the **Mesos slave**, delegates to the local **Docker daemon** for image discovery and management. The **executor** communicates with **Marathon** via the **Mesos master** and ensures that **Docker** enforces the specified resource limitations.

# Example: Docker on Mesos

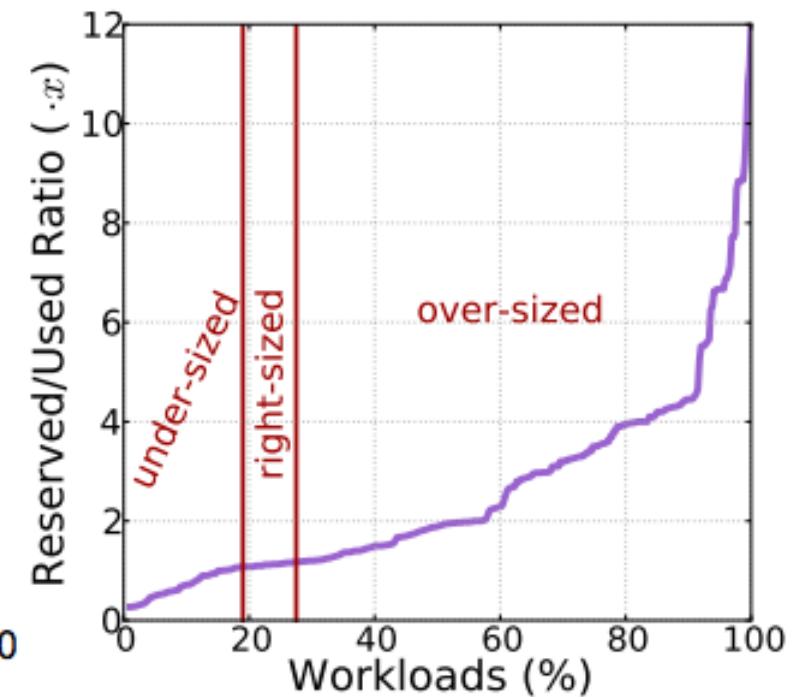

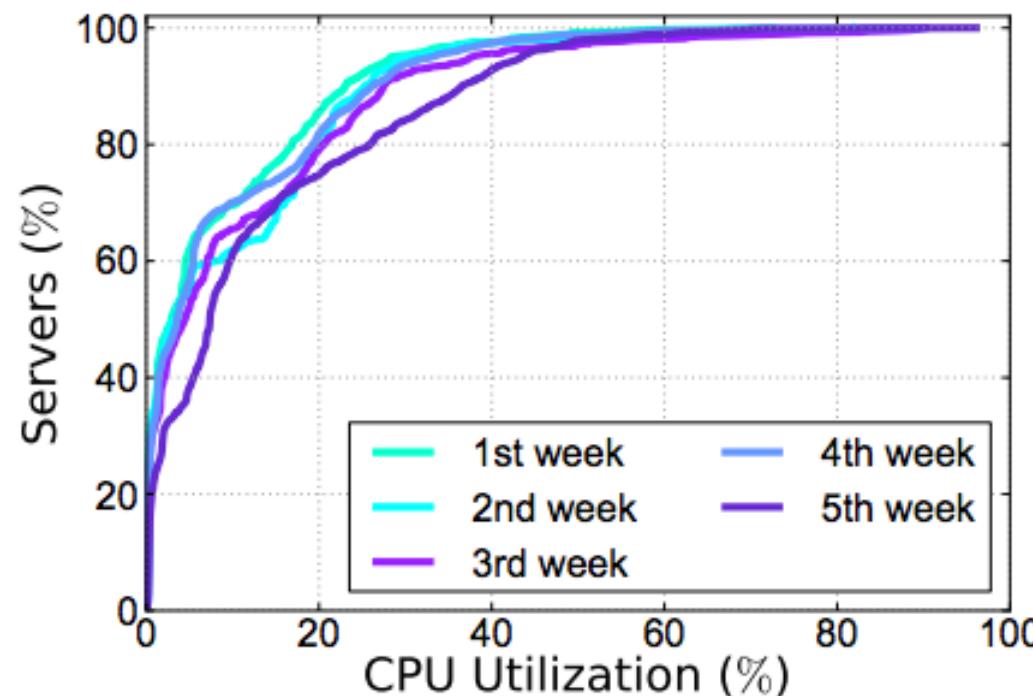

**Looking  
Ahead...**

# Quasar+Mesos @ Stanford, Twitter, etc....

Quasar: Resource-Efficient and QoS-Aware Cluster Management

**Christina Delimitrou, Christos Kozyrakis**

[stanford.edu/~cdel/2014.asplos.quasar.pdf](http://stanford.edu/~cdel/2014.asplos.quasar.pdf)

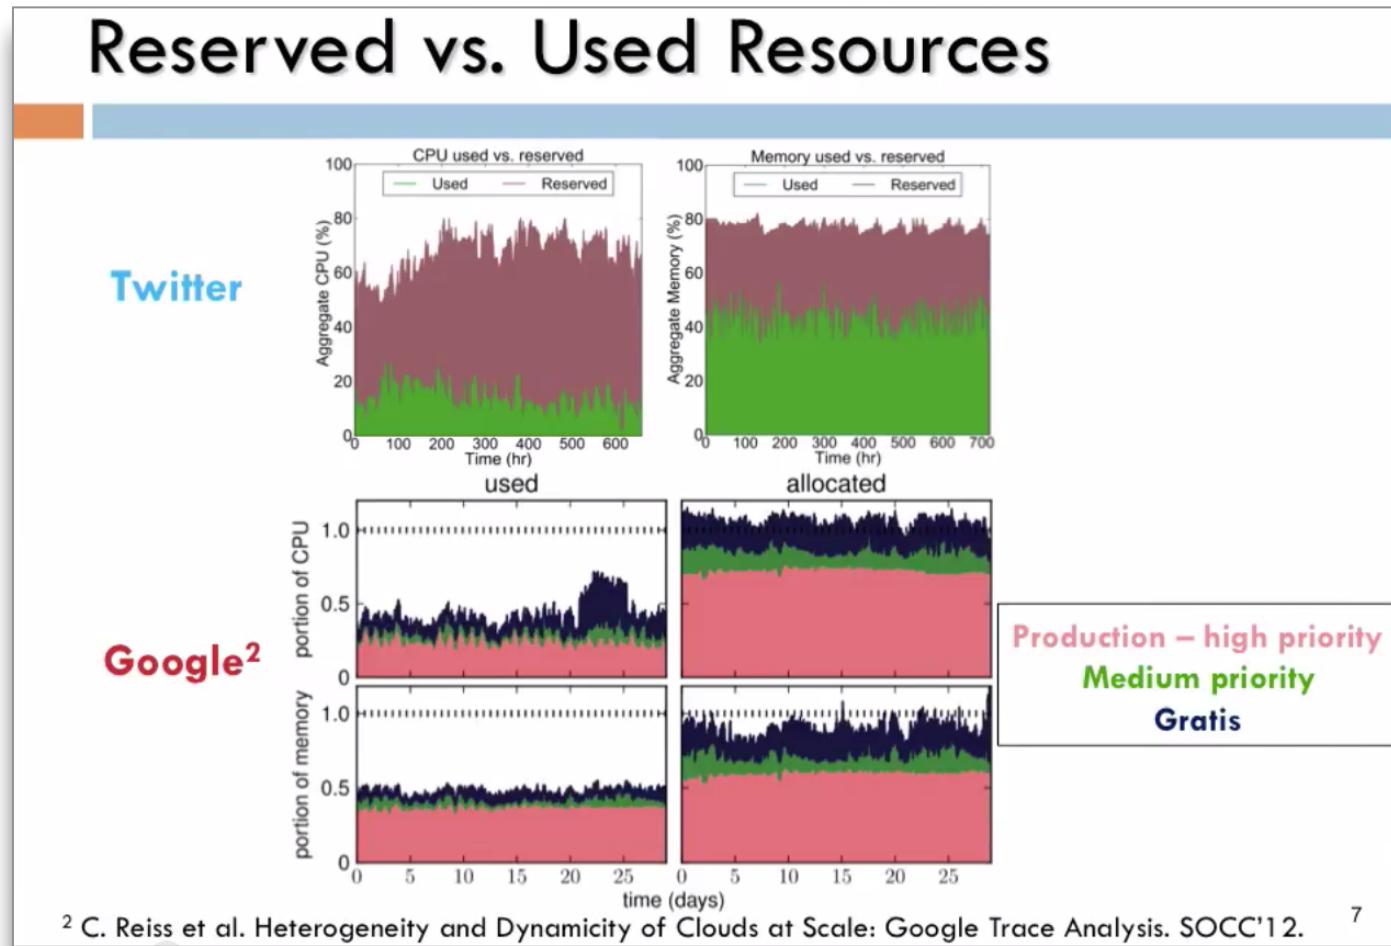

# Quasar+Mesos @ Stanford, Twitter, etc....

*Improving Resource Efficiency with Apache Mesos*

**Christina Delimitrou**

[youtu.be/YpmElyi94AA](https://youtu.be/YpmElyi94AA)

## **Quasar+Mesos @ Stanford, Twitter, etc....**

Consider that for datacenter computing at scale, surge in workloads implies:

- large cap-ex investment, long lead-time to build
- utilities cannot supply the power requirements

Even for large players that achieve 2x beyond typical industry DC util rates, those factors become show-stoppers. Even so, high rates of over-provisioning are typical, so there's much room to improve.

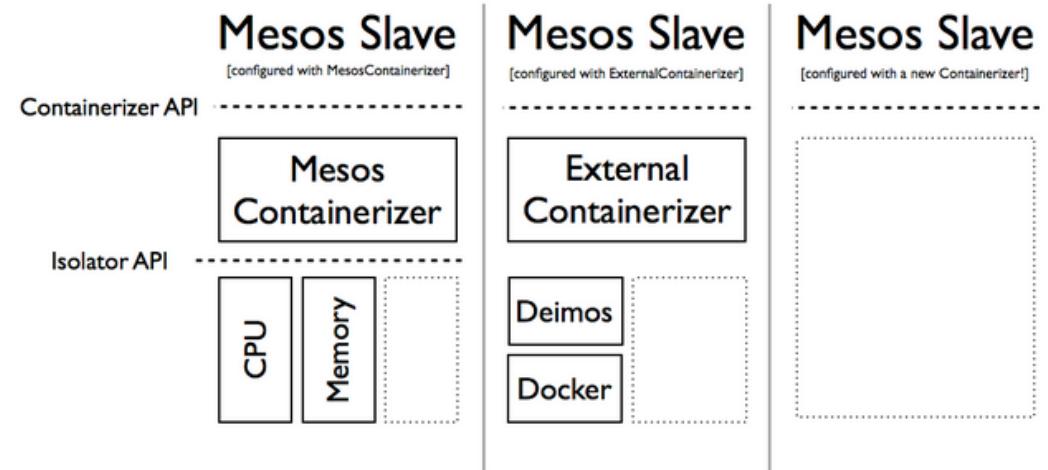

Experiences with Quasar+Mesos showed:

- 88% apps get >95% performance
- ~10% overprovisioning instead of 500%
- up to 70% cluster util at steady state
- 23% shorter scenario completion

# What's New in Mesos 0.18 ?

[mesos.apache.org/blog/mesos-0-18-0-released/](http://mesos.apache.org/blog/mesos-0-18-0-released/)

- Containerizer API
- Isolator API
- Cgroup layout change

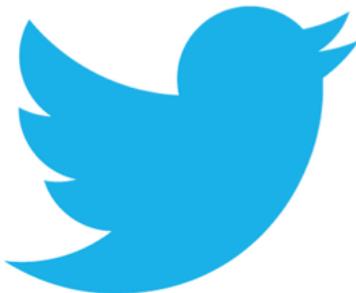

## Containerization and Docker:

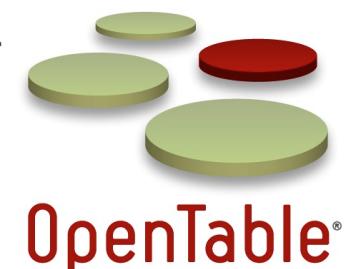

*“The first change is in terminology. The Mesos Slave now uses a Containerizer to provide an environment for each executor and its tasks to run in. Containerization includes resource isolation but is a more general concept that can encompass such things as packaging.”*

**Because...**  
**Use Cases**

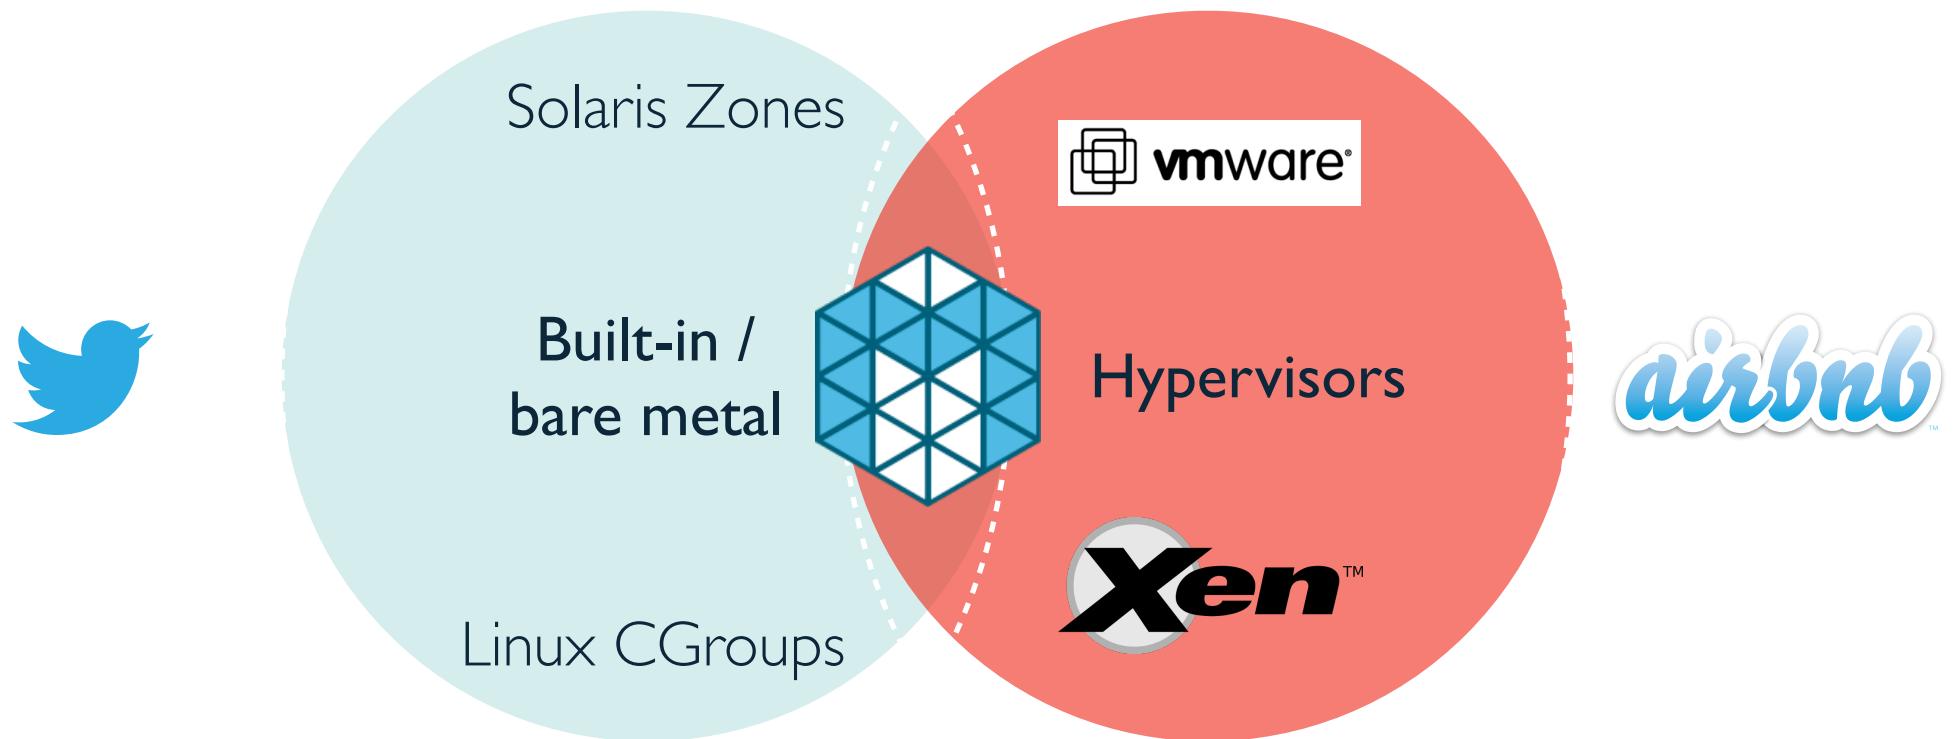

## Production Deployments (public)

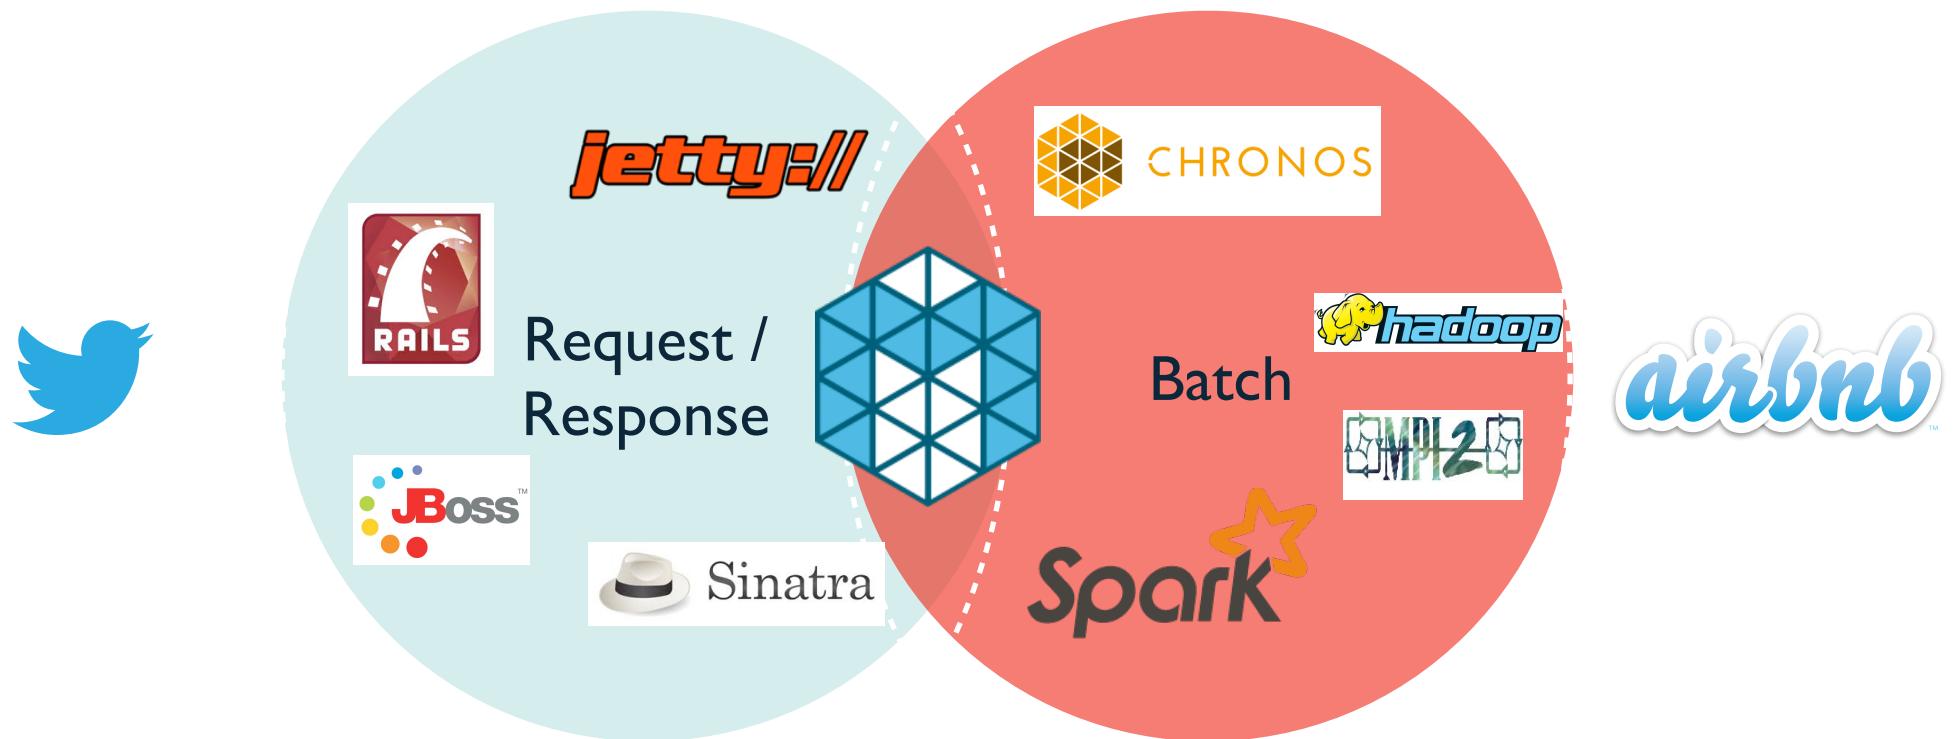

爱奇艺

# Opposite Ends of the Spectrum, One Common Substrate

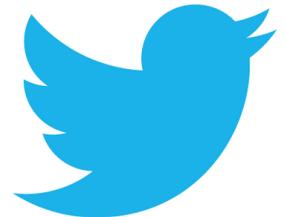

# Opposite Ends of the Spectrum, One Common Substrate

## **Case Study: Twitter (bare metal / on premise)**

*“Mesos is the cornerstone of our elastic compute infrastructure – it’s how we build all our new services and is critical for Twitter’s continued success at scale. It’s one of the primary keys to our data center efficiency.”*

**Chris Fry, SVP Engineering**

[blog.twitter.com/2013/mesos-graduates-from-apache-incubation](http://blog.twitter.com/2013/mesos-graduates-from-apache-incubation)

[wired.com/gadgetlab/2013/11/qa-with-chris-fry/](http://wired.com/gadgetlab/2013/11/qa-with-chris-fry/)

- key services run in production: analytics, typeahead, ads
- Twitter engineers rely on Mesos to build all new services
- instead of thinking about static machines, engineers think about resources like CPU, memory and disk
- allows services to scale and leverage a shared pool of servers across datacenters efficiently
- reduces the time between prototyping and launching

## **Case Study: Airbnb (fungible cloud infrastructure)**

*“We think we might be pushing data science in the field of travel more so than anyone has ever done before... a smaller number of engineers can have higher impact through automation on Mesos.”*

Mike Curtis, VP Engineering

[gigaom.com/2013/07/29/airbnb-is-engineering-itself-into-a-data...](http://gigaom.com/2013/07/29/airbnb-is-engineering-itself-into-a-data...)

- improves resource management and efficiency
- helps advance engineering strategy of building small teams that can move fast
- key to letting engineers make the most of AWS-based infrastructure beyond just Hadoop
- allowed company to migrate off Elastic MapReduce
- enables use of Hadoop along with Chronos, Spark, Storm, etc.

# Case Study: eBay (continuous integration)

eBay PaaS Team

[ebaytechblog.com/2014/04/04/delivering-ebays-ci-solution-with-apache-mesos-part-i/](http://ebaytechblog.com/2014/04/04/delivering-ebays-ci-solution-with-apache-mesos-part-i/)

- cluster management (PaaS core framework services) for CI
- integration of: OpenStack, Jenkins, Zookeeper, Mesos, Marathon, Ansible

*In eBay's existing CI model, each developer gets a personal CI/Jenkins Master instance. This Jenkins instance runs within a dedicated VM, and over time the result has been VM sprawl and poor resource utilization. We started looking at solutions to maximize our resource utilization and reduce the VM footprint while still preserving the individual CI instance model. After much deliberation, we chose Apache Mesos for a POC. This post shares the journey of how we approached this challenge and accomplished our goal.*

# Case Study: HubSpot (cluster management)

Tom Petr

[youtu.be/ROnI4csiikw](https://youtu.be/ROnI4csiikw)

- 500 deployable objects; 100 deploys/day to production; 90 engineers; 3 devops on Mesos cluster
- “Our QA cluster is now a fixed \$10K/month — that used to fluctuate”

MESOS

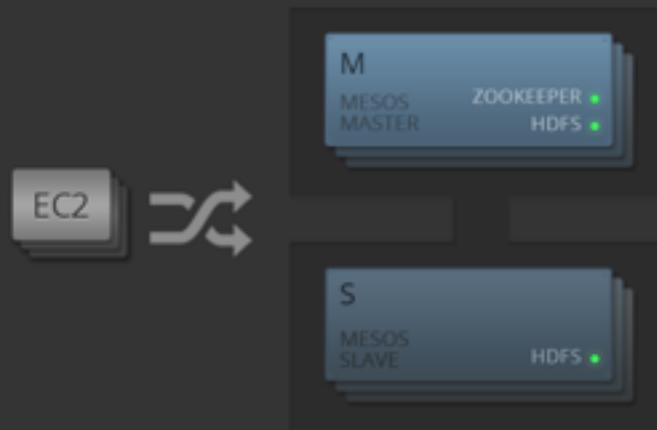

# DIY

**<http://elastic.mesosphere.io>**

**<http://mesosphere.io/learn>**

## Launch an Apache Mesos Cluster in ③ ② ①

Elastic Apache Mesos is a web service that automates the creation of Apache Mesos clusters on Amazon Elastic Compute Cloud (EC2). It provisions EC2 instances, installs dependencies including Apache ZooKeeper and HDFS, and delivers you a cluster with all the services running.

Mesos allows you to easily share compute resources and data between frameworks like Apache Hadoop and Apache Spark.

You just pay for your EC2 instances; Elastic Apache Mesos costs you nothing, nada, zilch on top of that.

## ③ Choose a cluster size

6 instances

12 vCPUs  
45 GiB memory

\$1.44 per hour<sup>1</sup>

18 instances

36 vCPUs  
135 GiB memory

\$4.32 per hour<sup>1</sup>

## 3 Choose a cluster size

<input checked="" type="radio"/> 6 instances	<input type="radio"/> 18 instances
12 vCPUs	36 vCPUs
45 GiB memory	135 GiB memory
\$1.44 per hour <sup>1</sup>	\$4.32 per hour <sup>1</sup>
Perfect for trying out Apache Mesos	Unleash the data-cruncher

1. Estimated price you will be charged in USD by Amazon EC2 after launching your cluster based on [on-demand instance prices](#). We charge you nothing, nada, \$0 on top of that!

All instances run in US East Region (N. Virginia) and use the following configuration:

- 2 vCPUs
- 7.5 GiB memory
- Ubuntu 12.10 (ami-2bc99d42)
- Type m1.large

## 2 Enter your credentials

Your credentials  
will be used to  
start your Mesos

AWS Access Key ID

3:20 PM (2 minutes ago)

Great news,

Your Apache Mesos cluster is up and running!

View running frameworks and tasks in your Mesos UI:

<http://54.235.3.97:5050>

To get started with Hadoop on Mesos, visit the [Hadoop on Mesos quickstart tutorial](#).

For more advanced Hadoop use, visit the [Package Hadoop for Mesos tutorial](#).

For fast in-memory number crunching, try the [Apache Spark on Mesos tutorial](#).

To run repeating jobs via Chronos, visit the [Chronos on Mesos tutorial](#).

To learn how to build ETL pipelines, try [ETL with Chronos and Hadoop](#).

And to run your long-lived services, visit the [Marathon tutorial](#).

The IP addresses of your Mesos master nodes are: 54.235.3.97 54.204.193.157 54.204.133.148

Your Mesos slave nodes are: 54.234.5.237 54.221.134.235 54.227.20.164

You can connect to your instances via ssh using the "ubuntu" user.

Shutdown your cluster on Elastic Apache Mesos:

<https://elastic.mesosphere.io/clusters/54.235.3.97>

View running instances on AWS:

<https://console.aws.amazon.com/ec2/v2/home?region=us-east-1>

Have fun,

The Mesosphere Team

# Learn how to use Apache Mesos

Getting started is easy.

Launch a cluster with Elastic Apache Mesos in 20 minutes or less and then try out these tutorials.

[Launch a Mesos cluster](#)

## Mesos Tutorials

### Quickstart Apache Hadoop on Mesos

25 minutes | 12 Nov 2013

Running Hadoop on Mesos distributes MapReduce jobs efficiently across an entire cluster. In this tutorial, we use the Mesosphere Hadoop Installer to setup Hadoop on Mesos. This tutorial works best when using Elastic Mesos.

#### Resources

- [Apache Hadoop](#)
- [Apache Mesos](#)

### Package Apache Hadoop for Mesos

40 minutes | 12 Nov 2013

Running Hadoop on Mesos distributes MapReduce jobs efficiently across an entire cluster. Here we show how to package and install Hadoop on a Mesos cluster, then run a Hadoop job and find its output.

#### Resources

- [Apache Hadoop](#)
- [Apache Mesos](#)

### Run Apache Spark on Mesos

30 minutes | 12 Nov 2013

Spark is a fast and general-purpose cluster computing system

### Run Chronos on Mesos

35 minutes | 12 Nov 2013

Chronos is a distributed and fault-tolerant job scheduler that

Resources

- [Apache Hadoop](#)
- [Apache Mesos](#)

## Run Apache Spark on Mesos

30 minutes | 12 Nov 2013

Spark is a fast and general-purpose cluster computing system which makes parallel jobs easy to write. This tutorial shows you how to run Spark on Mesos.

Resources

- [Apache Mesos](#)
- [Apache Spark](#)

Resources

- [Apache Hadoop](#)
- [Apache Mesos](#)

## Run Chronos on Mesos

35 minutes | 12 Nov 2013

Chronos is a distributed and fault-tolerant job scheduler that supports complex job topologies. This walkthrough shows how to install Chronos on a Mesos cluster, how to use Chronos' web UI to schedule a job, and how to navigate the Mesos web UI to find the job's output.

Resources

- [Chronos](#)
- [Apache Mesos](#)

## ETL with Chronos and Hadoop

35 minutes | 12 Nov 2013

This tutorial shows you how to use Chronos to schedule a typical ETL pipeline that downloads some data, runs a Hadoop job, and prints the output, all on the same cluster.

Resources

- [Chronos](#)
- [Apache Mesos](#)
- [Apache Hadoop](#)

## Run services with Marathon

30 minutes | 12 Nov 2013

Marathon is a Mesos framework for long-running services. It ensures that a service stays up even when machines or entire racks fail. This tutorial shows you how to install Marathon on a Mesos cluster and run an example web app with it.

Resources

- [Marathon](#)
- [Apache Mesos](#)
